#1 How to design, create, and support dedicated languages (DSLs)?

#2 How to transform models/programs?

#3 How to manage variability/variants?

#4 How do frameworks internally work?

Plan

- Domain-Specific Languages (DSLs)
  - Languages and abstraction gap
  - Examples and rationale
  - DSLs vs General purpose languages, taxonomy
- External DSLs
  - Grammar and parsing
  - Xtext
- DSLs, DSMLs, and (meta-)modeling

Contract

- Better understanding/source of inspiration of software languages and DSLs
  - Revisit of history and existing languages
- Foundations and practice of Xtext
  - State-of-the-art language workbench (Most Innovative Eclipse Project in 2010, mature and used in a variety of industries)
- Models and Languages
  - Perhaps a more concrete way to see models, metamodels and MDE (IDM in french)

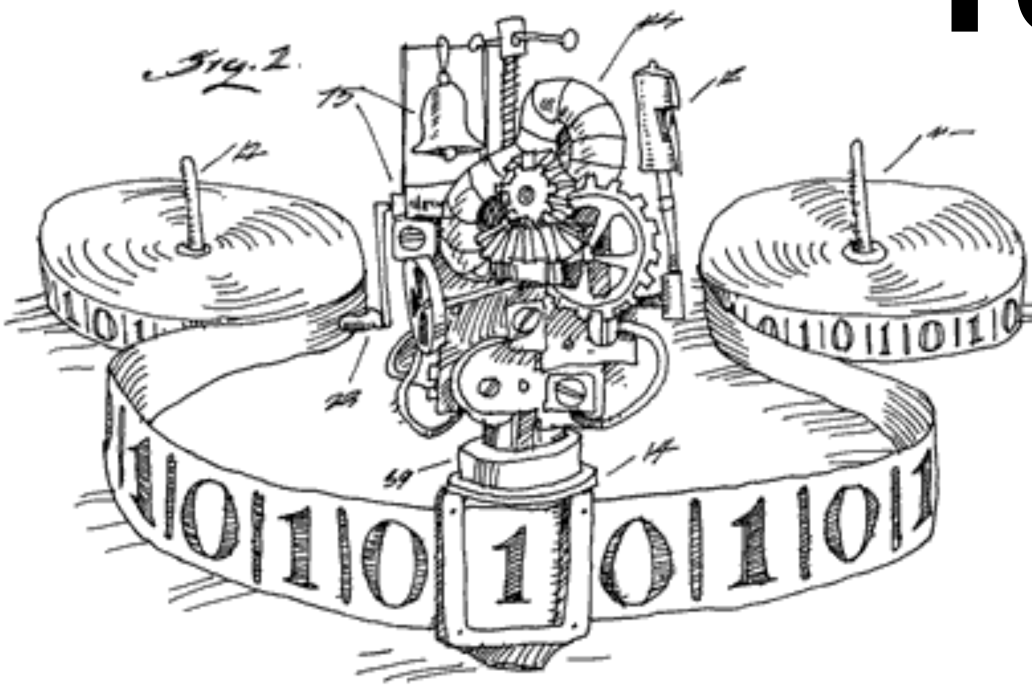
What are DSLs

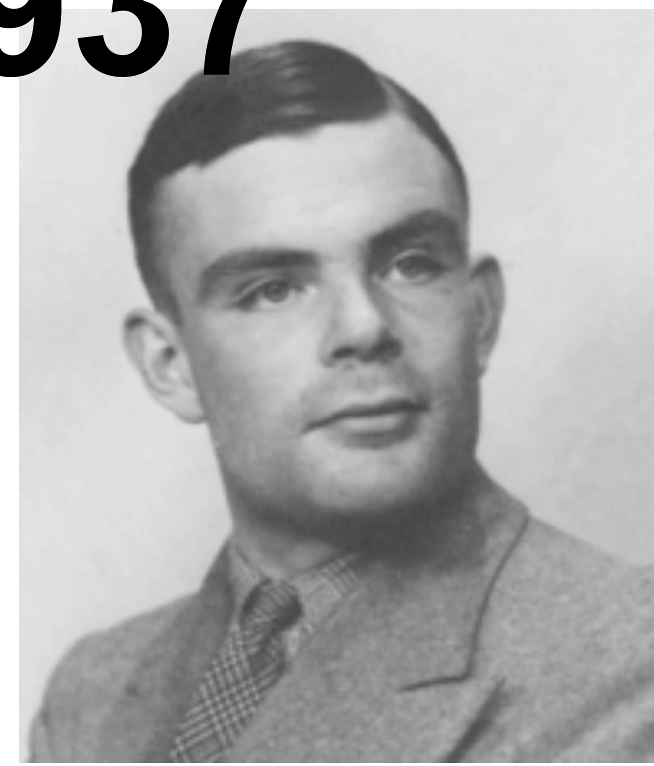
Where are DSLs

Why DSLs (will) matter

The (Hi)Story of Software Engineering / Computer Science

1937



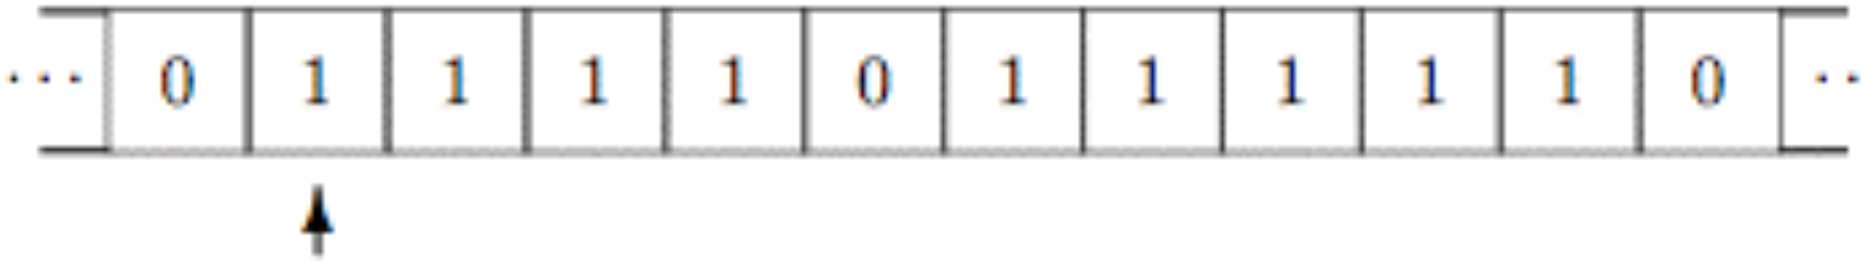


Turing Machine

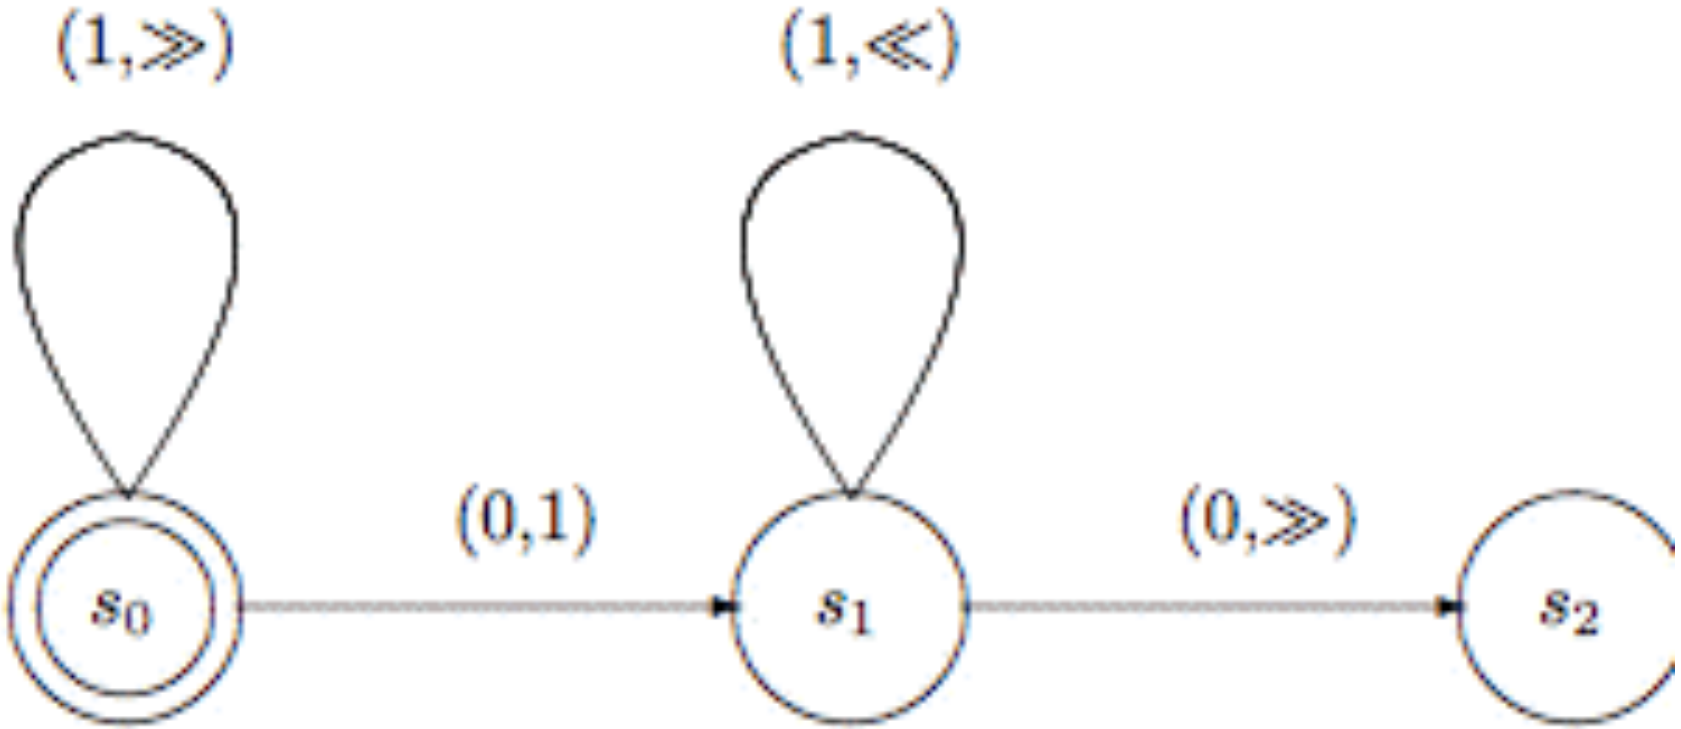
- Infinite tape divided into Cells (0 or 1)
- Read-Write Head
- Transitition rules

Write a symbol
or move to left (>>) or right (<<)

$$\langle\ State_{\text{current}}, Symbol, State_{\text{next}}, Action\ \rangle$$



Turing Machine
~ kind of state machine



Successor (add-one) function

assuming that number n as a block of n+1 copies of the symbol ‘1’ on the tape (here, n=3)

What is a language?

- « A system of signs, symbols, gestures, or rules used in **communicating** »
- « The **special** vocabulary and usages of a scientific, professional, or other group »
- « A system of symbols and rules used for communication with or between computers. »

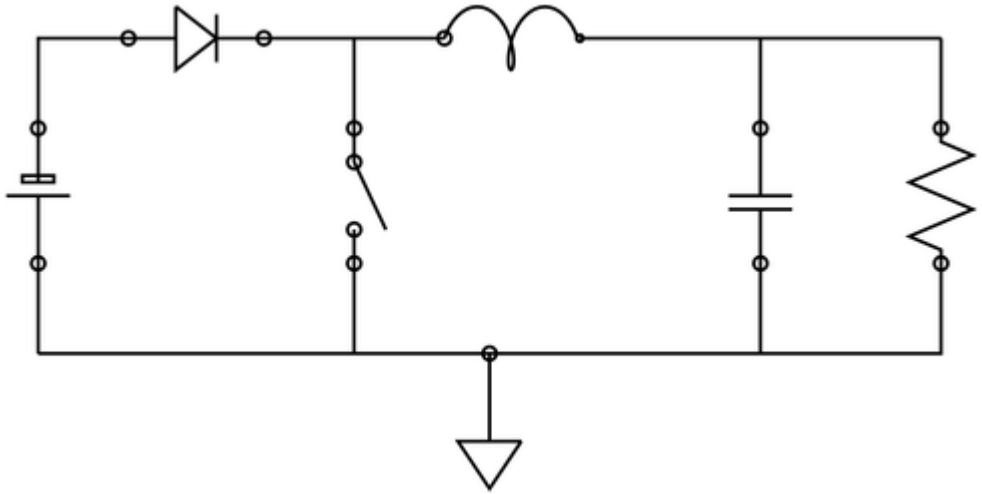
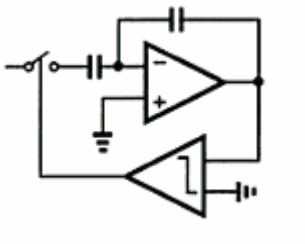
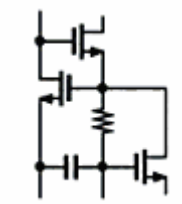
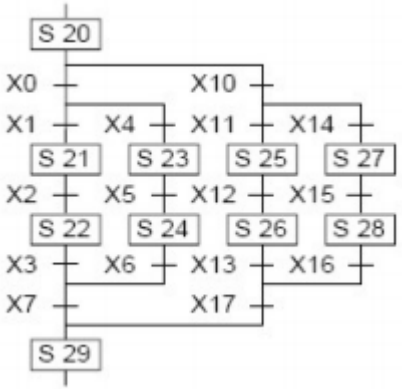
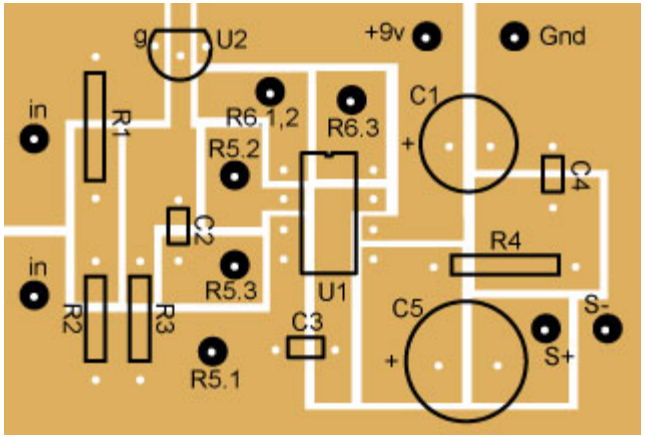
Electronics









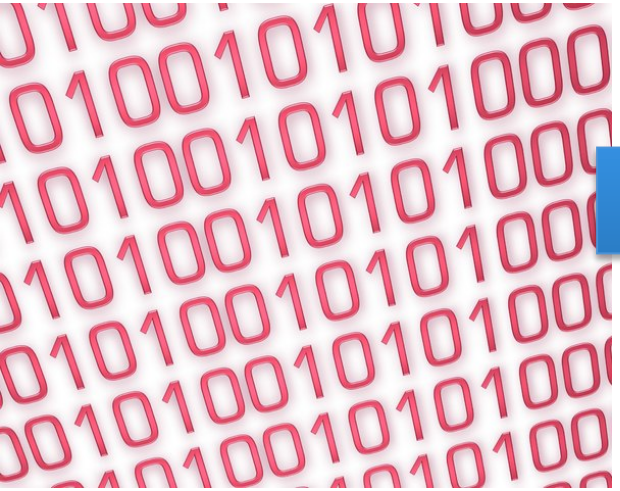


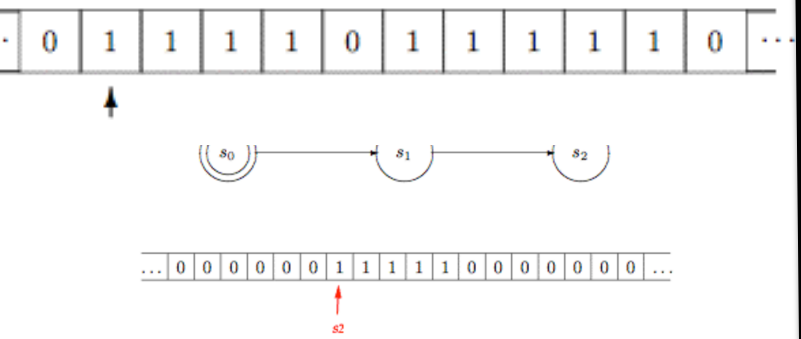
In Software Engineering

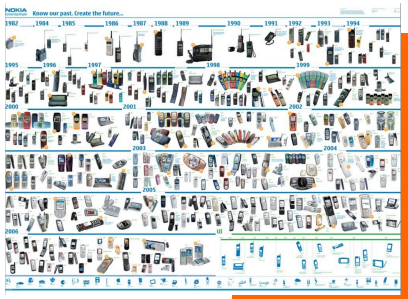
« Languages are the primary way in which system developers communicate, design and implement software systems »

General Purpose Languages

Assembly ?
COBOL ? LISP ? C ? C++ ?
Java? PHP ? C# ? Ruby ?



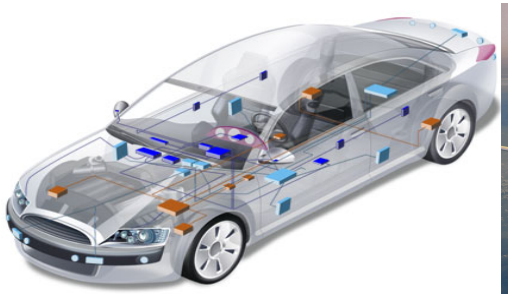




orange™

Google

twitter



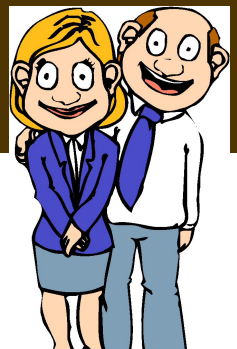
Limits of General Purpose Languages (1)

- **Abstractions** and **notations** used are not natural/suitable for the stakeholders

```
if (newGame) resources.free();
s = FILENAME + 3;
setLocation(); load(s);
loadDialog.process();

try { setGamerColor(RED); }
catch(Exception e) { reset(); }
while (notReady) { objects.make();
if (resourceNotFound) break; }

byte result; // сменить на int!
music();
System.out.print("");
```



Limits of General Purpose Languages (2)

- Not targeted to a **particular** kind of problem, but to any kinds of software problem.

Domain Specific Languages

- Targeted to a **particular** kind of problem, with dedicated notations (textual or graphical), support (editor, checkers, etc.)
- Promises: more « efficient » languages for resolving a set of specific problems in a domain

Domain Specific Languages (DSLs)

- Long history: used for almost as long as computing has been done.
- You're using DSLs in a daily basis
- You've learnt many DSLs in your curriculum
- Examples to come!

HTML

```
<?xml version="1.0" encoding="iso-8859-1"?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN" "DTD/xhtml1-transitional.dtd">
<html xml:lang="en" lang="en" xmlns="http://www.w3.org/1999/xhtml">
  <head>
      <title>Hello World</title>
  </head>
  <body>
      <p>My first Web page.</p>
  </body>
</html>
```

Domain: web (markup)

CSS

```
.CodeMirror {
  line-height: 1;
  position: relative;
  overflow: hidden;
}

.CodeMirror-scroll {
  /* 30px is the magic margin used to hide the element's real scrollbars */
  /* See overflow: hidden in .CodeMirror, and the paddings in .CodeMirror-sizer */
  margin-bottom: -30px; margin-right: -30px;
  padding-bottom: 30px; padding-right: 30px;
  height: 100%;
  outline: none; /* Prevent dragging from highlighting the element */
  position: relative;
}
.CodeMirror-sizer {
  position: relative;
}
```

Domain: web (styling)

SQL

```
SELECT Book.title AS Title,
       COUNT(*) AS Authors
 FROM  Book
 JOIN  Book_author
   ON  Book.isbn = Book_author.isbn
 GROUP BY Book.title;

 INSERT INTO example
 (field1, field2, field3)
 VALUES
 ('test', 'N', NULL);
```

Domain: database (query)

Makefile

```
PACKAGE      = package
    VERSION      = ` date "+%Y.%m%d%" `
    RELEASE_DIR  = ..
    RELEASE_FILE = $(PACKAGE)-$(VERSION)

    # Notice that the variable LOGNAME comes from the environment in
    # POSIX shells.
    #
    # target: all - Default target. Does nothing.
    all:
            echo "Hello $(LOGNAME), nothing to do by default"
            # sometimes: echo "Hello ${LOGNAME}, nothing to do by default"
            echo "Try 'make help'"

    # target: help - Display callable targets.
    help:
            egrep "^# target:" [Mm]akefile

    # target: list - List source files
    list:
            # Won't work. Each command is in separate shell
            cd src
            ls

            # Correct, continuation of the same shell
            cd src; \
            ls
```

Domain: software building

Lighthttpd configuration file

```

« Another lesson we should have learned from the recent past is that the development of 'richer' or 'more powerful' programming languages was a mistake in the sense that these baroque monstrosities, these conglomerations of idiosyncrasies, are really unmanageable, both mechanically and mentally.

aka **General-Purpose Languages**

I see a great future for very systematic and very modest programming languages »

aka **Domain-Specific Languages**

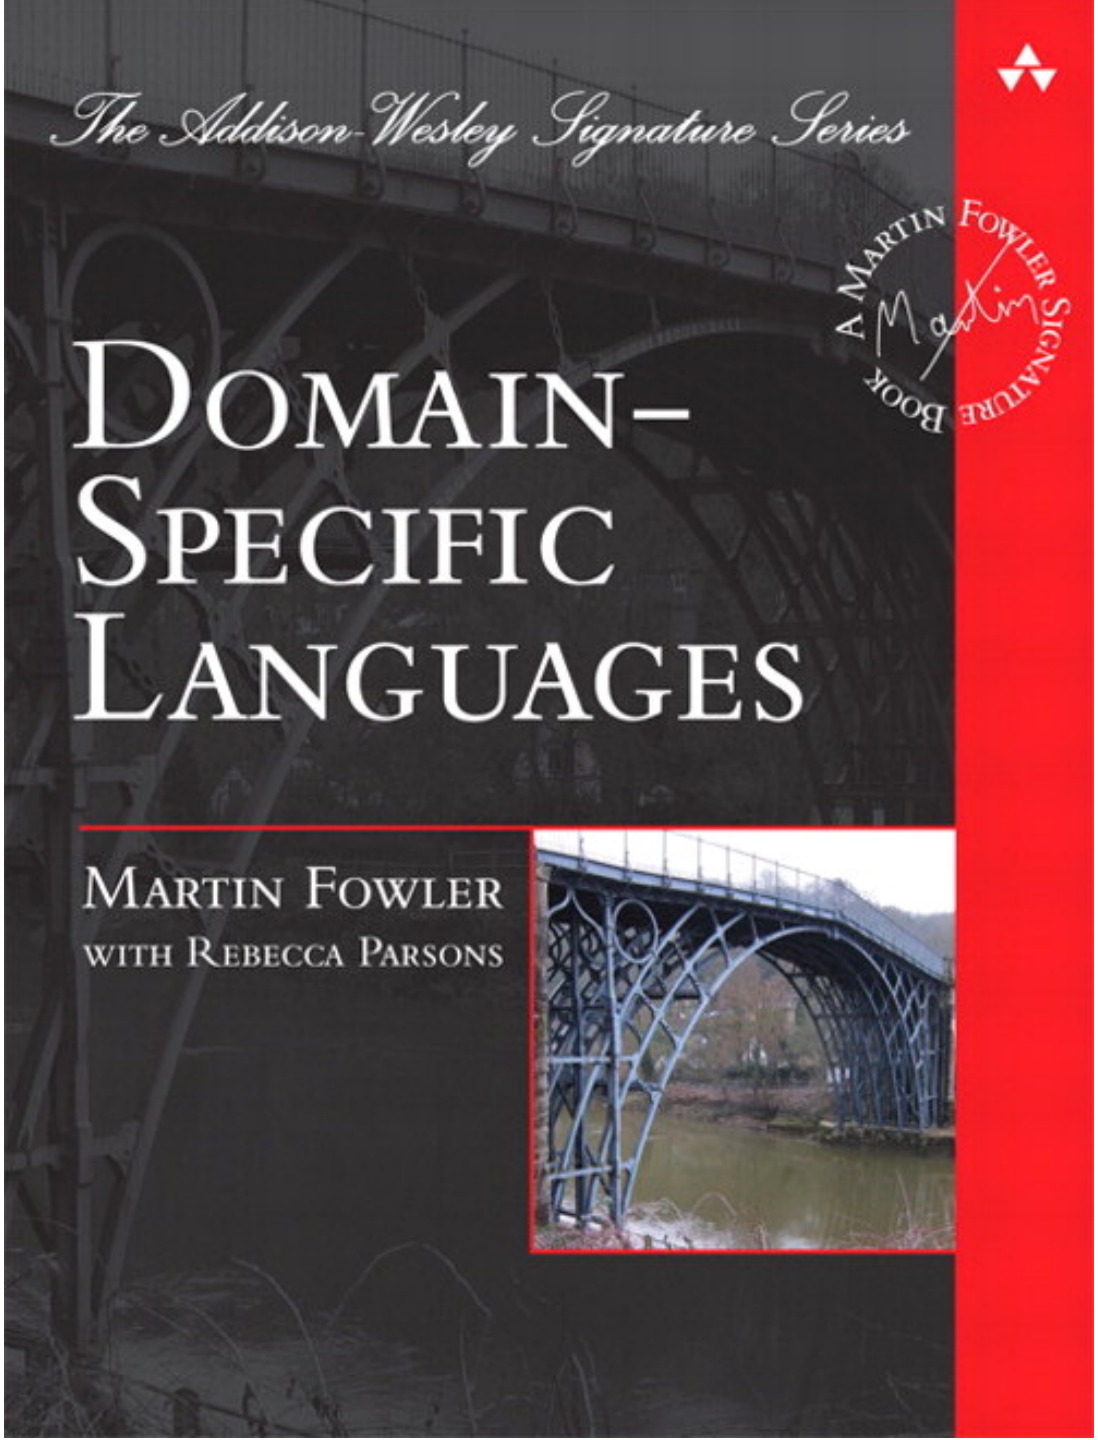
« Domain-specific languages are far more prevalent than anticipated »



The Addison-Wesley Signature Series
A Martin Fowler Signature Book
Domain-Specific Languages
Martin Fowler
with Rebecca Parsons

2011

What is a domain-specific language ?

- « Language **specially** designed to perform a task in a **certain domain** »
- « A formal processable language targeting at a **specific viewpoint or aspect** of a software system. Its **semantics and notation** is designed in order to support working with that viewpoint as good as possible »
- « A computer language that's targeted to a particular kind of problem, **rather than a general purpose language** that's aimed at any kind of software problem. »

GPL (General Purpose Language)

A GPL provides notations that are used to describe a computation in a human-readable form that can be translated into a machine-readable representation.

A GPL is a formal notation that can be used to describe problem solutions in a precise manner.

A GPL is a notation that can be used to write programs.

A GPL is a notation for expressing computation.

A GPL is a standardized communication technique for expressing instructions to a computer. It is a set of syntactic and semantic rules used to define computer programs.

Promises of domain-specific languages

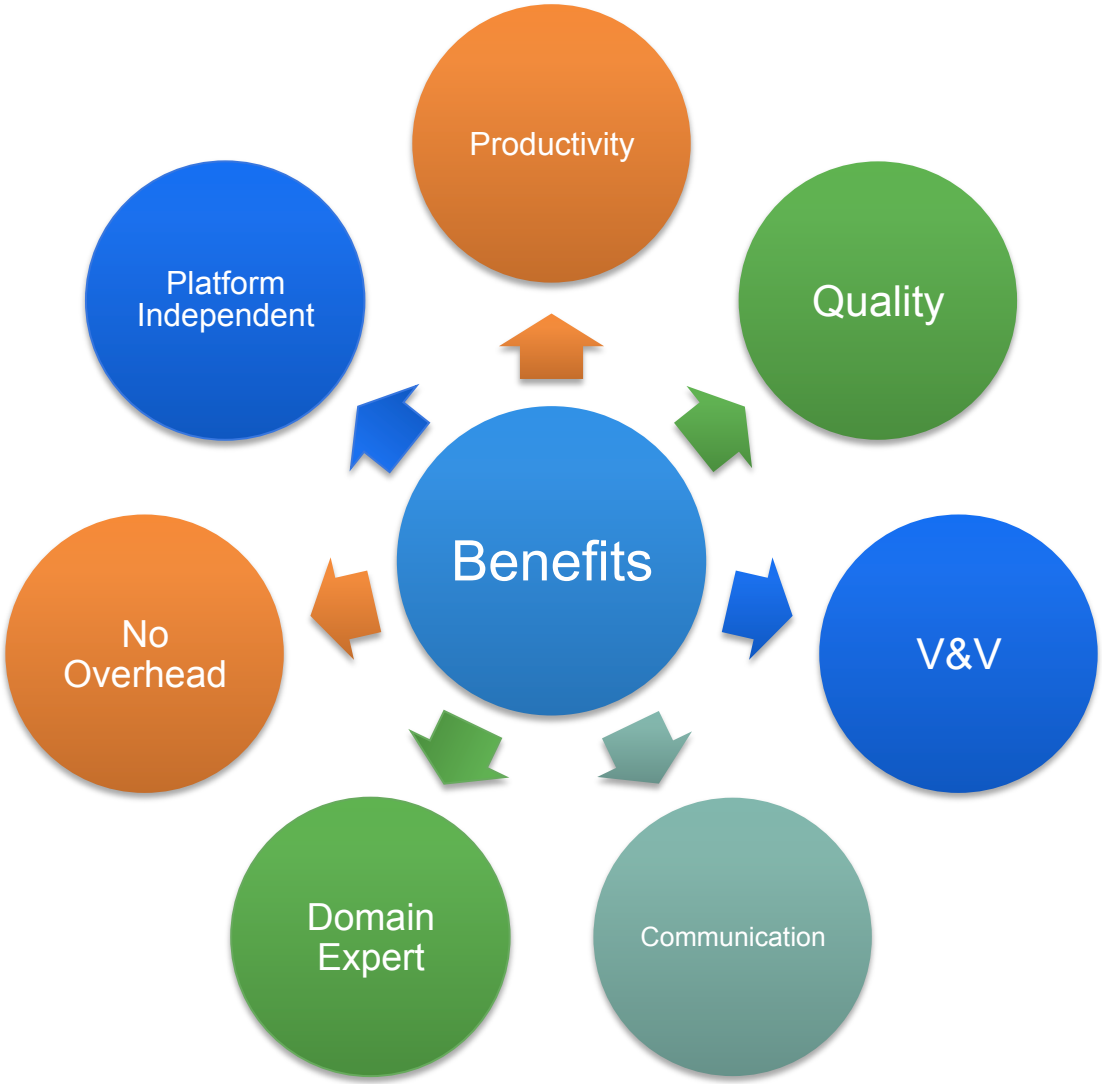
Higher abstractions

Avoid redundancy

Separation of concerns

Use domain concepts

Promises of domain-specific languages



GeneralPL vs DomainSL

The boundary isn't as clear as it could be. Domain-specificity is not black-and-white, but instead gradual: a language is more or less domain specific

	GPLs	DSLs
Domain	large and complex	smaller and well-defined
Language size	large	small
Turing completeness	always	often not
User-defined abstractions	sophisticated	limited
Execution	via intermediate GPL	native
Lifespan	years to decades	months to years (driven by context)
Designed by	guru or committee	a few engineers and domain experts
User community	large, anonymous and widespread	small, accessible and local
Evolution	slow, often standardized	fast-paced
Deprecation/incompatible changes	almost impossible	feasible

Quizz Time

- #2 e9a8d603
- Take one DSL and formulate assumptions on their qualities (and superiority to a GPL-based solution)
- Imagine an experience for providing evidence that the DSL has such qualities

External DSLs vs Internal DSLs

- An **external** DSL is a completely separate language and has its own custom syntax/ tooling support (e.g., editor)

- An internal DSL is more or less a set of APIs written on top of a host language (e.g., Java).
  - Fluent interfaces

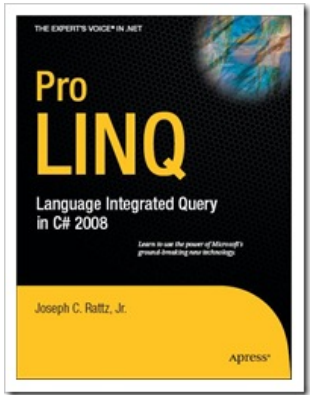
External vs Internal DSL (SQL example)

```
-- Select all books by authors born after 1920,
-- named "Paulo" from a catalogue:
SELECT *
  FROM t_author a
  JOIN t_book b ON a.id = b.author_id
 WHERE a.year_of_birth > 1920
   AND a.first_name = 'Paulo'
 ORDER BY b.title
```

```
Result<Record> result =
create.select()
      .from(T_AUTHOR.as("a"))
      .join(T_BOOK.as("b")).on(a.ID.equal(b.AUTHOR_ID))
      .where(a.YEAR_OF_BIRTH.greaterThan(1920)
      .and(a.FIRST_NAME.equal("Paulo")))
      .orderBy(b.TITLE)
      .fetch();
```

Internal DSL (LINQ/C# example)

```
// DataContext takes a connection string
DataContext db = new   DataContext("c:\\northwind\\northwnd.mdf");
// Get a typed table to run queries
Table<Customer> Customers = db.GetTable<Customer>();
// Query for customers from London
var q =
   from c in Customers
   where c.City == "London"
   select c;
foreach (var cust in q)
   Console.WriteLine("id = {0}, City = {1}", cust.CustomerID, cust.City);
```



Internal DSL

- « Using a host language (e.g., Java) to give the host language the feel of a particular language. »
- **Fluent** Interfaces
  - « The more the use of the API has that language like flow, the more fluent it is »

```
-- Select all books by authors born after 1920,
-- named "Paulo" from a catalogue:
SELECT *
  FROM t_author a
  JOIN t_book b ON a.id = b.author_id
 WHERE a.year_of_birth > 1920
   AND a.first_name = 'Paulo'
 ORDER BY b.title
```

```
Result<Record> result =
create.select()
      .from(T_AUTHOR.as("a"))
      .join(T_BOOK.as("b")).on(a.ID.equal(b.AUTHOR_ID))
      .where(a.YEAR_OF_BIRTH.greaterThan(1920)
      .and(a.FIRST_NAME.equal("Paulo")))
      .orderBy(b.TITLE)
      .fetch();
```

SQL in… Java

DSL in GPL

```
Connection con = null;

// create sql insert query
String query = "insert into user values(" + student.getId() + ",'"
  + student.getFirstName() + "','" + student.getLastName()
  + "','" + student.getEmail() + "','" + student.getPhone()
  + "')";
try {
 // get connection to db
 con = new CreateConnection().getConnection("checkjdbc", "root",
   "root");

 // get a statement to execute query
 stmt = con.createStatement();

 // executed insert query
 stmt.execute(query);
 System.out.println("Data inserted in table !");
```

Regular expression in… Java

DSL in GPL

```
public class RegexTestStrings {
  public static final String EXAMPLE_TEST = "This is my small example "
      + "string which I'm going to " + "use for pattern matching.";

  public static void main(String[] args) {
    System.out.println(EXAMPLE_TEST.matches("\\w.*"));
    String[] splitString = (EXAMPLE_TEST.split("\\s+"));
    System.out.println(splitString.length);// Should be 14
    for (String string : splitString) {
      System.out.println(string);
    }
    // Replace all whitespace with tabs
    System.out.println(EXAMPLE_TEST.replaceAll("\\s+", "\t"));
  }
}
```

Internal DSLs vs External DSL

- Both internal and external DSLs have strengths and weaknesses
  - learning curve,
  - cost of building,
  - programmer familiarity,
  - communication with domain experts,
  - mixing in the host language,
  - strong expressiveness boundary
- Focus of the course
  - **external DSL** a completely separate language with its own custom syntax and tooling support (e.g., editor)

Quizz Time

- #3 e9a8d603

- Find a DSL that is both internal and external

HTML

- External DSL: <html>….
- Internal DSLs
  - LISP
  - Scala (XML support included in the language)

```
object XMLTest1 extends Application {
  val page =
  <html>
    <head>
      <title>Hello XHTML world</title>
    </head>
    <body>
      <h1>Hello world</h1>
      <p><a href="scala-lang.org">Scala</a> talks XHTML</p>
    </body>
  </html>;
  println(page.toString())
}
```

SQL

Plain SQL
(external DSL)

shape
#1

```sql
-- SQL
SELECT * FROM journal
   WHERE published_year = 2013
     AND publisher = 'IEEE'
ORDER BY title
```

Java
(internal DSL)

shape
#2

```java
// JOOQ fluent API
ResultQuery q = create.selectFrom(JOURNAL)
            .where(PUBLISHED_YEAR.equal(2013)
            .and(PUBLISHER.equal("IEEE")))
            .orderBy(TITLE);
```

Scala
(internal DSL)

shape
#3

```scala
journals
  .filter(journal => journal.published_year === 2013
       && journal.publisher === "IEEE")
  .sortBy(_.title)
```

Homework

- Deadline: 17th october
  - email: mathieu.acher@irisa.fr
- Choose a DSL that is both external and internal (but not SQL).
- The exercice is to develop a program in the DSL in three equivalent variants:
  - Two variants with an internal shape of the DSL, in two different GPLs
  - One variant with the external shape of the DSL
  - The three variants should have the same behavior
- Source code and instructions on how to execute the programs on the repository (by pull request):
  - https://github.com/acherm/metamorphicDSL-IDM1516

Plan

- Domain-Specific Languages (DSLs)
  - Languages and abstraction gap
  - Examples and rationale
  - DSLs vs General purpose languages, taxonomy
- External DSLs
  - Grammar and parsing
  - Xtext
- DSLs, DSMLs, and (meta-)modeling

Contract

- Better understanding/source of inspiration of software languages and DSLs
  - Revisit of history and existing languages
- Foundations and practice of Xtext
  - State-of-the-art language workbench (Most Innovative Eclipse Project in 2010, mature and used in a variety of industries)
- Models and Languages
  - Perhaps a more concrete way to see models, metamodels and MDE (IDM in french)

Xtext, a popular, easy-to-use model-based tool for developping DSLs

Your DSL in 5' (incl. editors and serializers)

Foundations (or some course refresh)

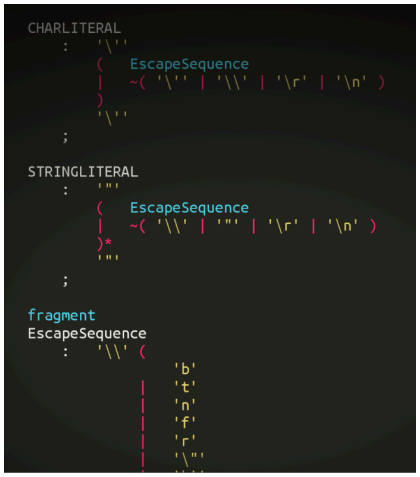
Java Grammar



```
CHARLITERAL
    :   '\''
        (   EscapeSequence
        |   ~( '\'' | '\\' | '\r' | '\n' )
        )
        '\''
    ;

STRINGLITERAL
    :   '"'
        (   EscapeSequence
        |   ~( '\\' | '"' | '\r' | '\n' )
        )*
        '"'
    ;

fragment
EscapeSequence
    :   '\\' (
                'b'
            |   't'
            |   'n'
            |   'f'
            |   'r'
            |   '\"'
```

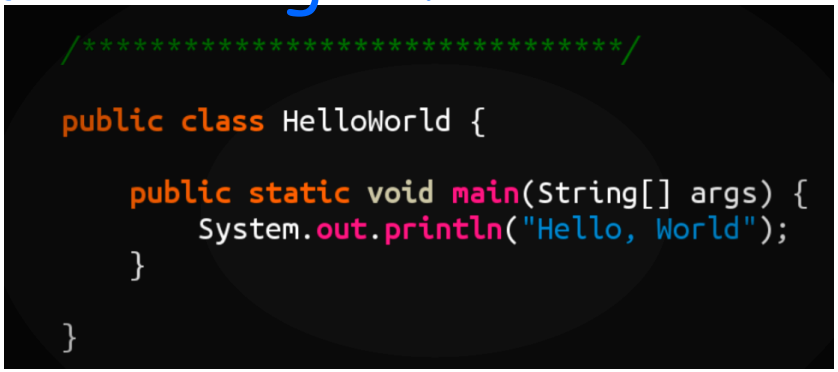
```
classOrInterfaceDeclaration
    :   classDeclaration
    |   interfaceDeclaration
    ;

modifiers
    :
    (   annotation
    |   PUBLIC
    |   PROTECTED
    |   PRIVATE
    |   STATIC
    |   ABSTRACT
    |   FINAL
    |   NATIVE
    |   SYNCHRONIZED
    |   TRANSIENT
    |   VOLATILE
    |   STRICTFP
    )*
    ;

variableModifiers
    :   (   FINAL
        |   annotation
        )*
    ;

classDeclaration
    :   normalClassDeclaration
    |   enumDeclaration
```

Java Program



```
/*********************************/

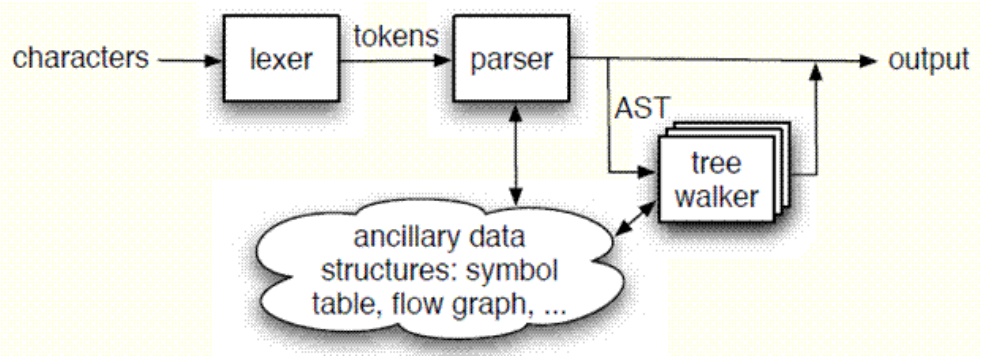
public class HelloWorld {

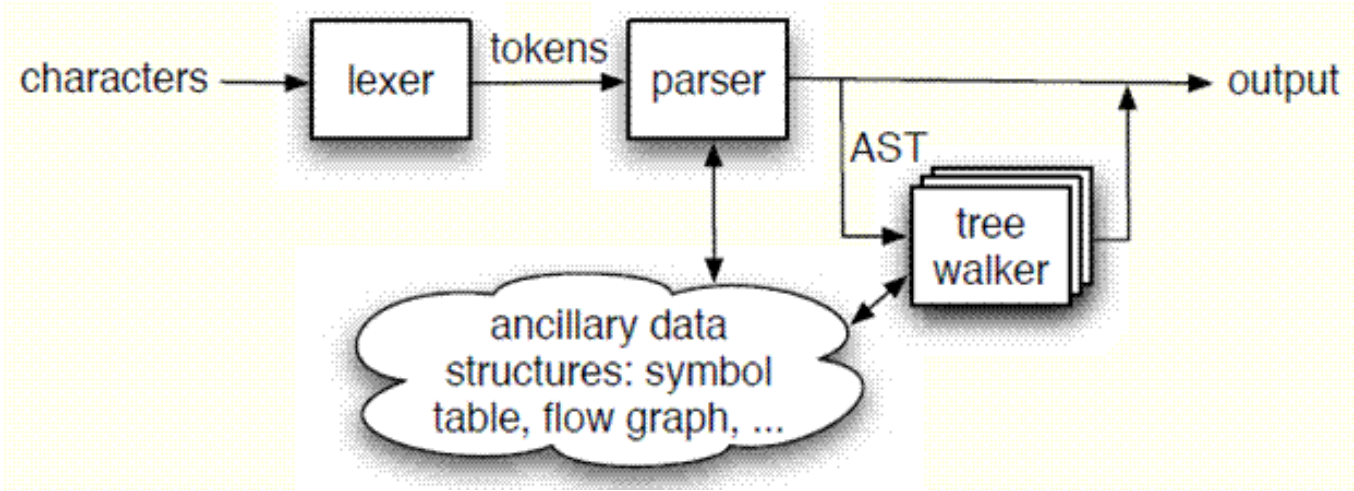
    public static void main(String[] args) {
        System.out.println("Hello, World");
    }

}
```

Compilation Process

- Source code
  - Concrete syntax used for specifying a program
  - Conformant to a grammar
- Lexical analysis
  - Conveting a sequence of characters into a sequence of **tokens**
- Parsing (Syntactical analysis)
  - Abtsract Syntax Tree (AST)





```
CHARLITERAL
    :   '\''
        (   EscapeSequence
        |   ~( '\'' | '\\' | '\r' | '\n' )
        )
        '\''
    ;

STRINGLITERAL
    :   '"'
        (   EscapeSequence
        |   ~( '\\' | '"' | '\r' | '\n' )
        )*
        '"'
    ;

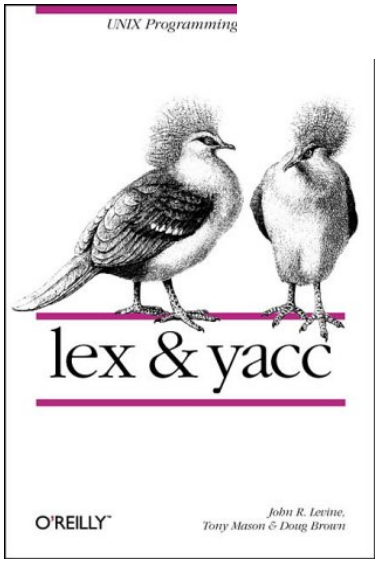
fragment
EscapeSequence
    :   '\\' (
                'b'
            |   't'
            |   'n'
            |   'f'
            |   'r'
            |   '\"'
            |   '\''
```

```
classOrInterfaceDeclaration
    :   classDeclaration
    |   interfaceDeclaration
    ;

modifiers
    :
    (   annotation
    |   PUBLIC
    |   PROTECTED
    |   PRIVATE
    |   STATIC
    |   ABSTRACT
    |   FINAL
    |   NATIVE
    |   SYNCHRONIZED
    |   TRANSIENT
    |   VOLATILE
    |   STRICTFP
    )*
    ;

variableModifiers
    :   (   FINAL
        |   annotation
        )*
    ;

classDeclaration
    :   normalClassDeclaration
    |   enumDeclaration
```



EXEMPLE

```
function foo() {
  echo «Hello, World !»;
}
```

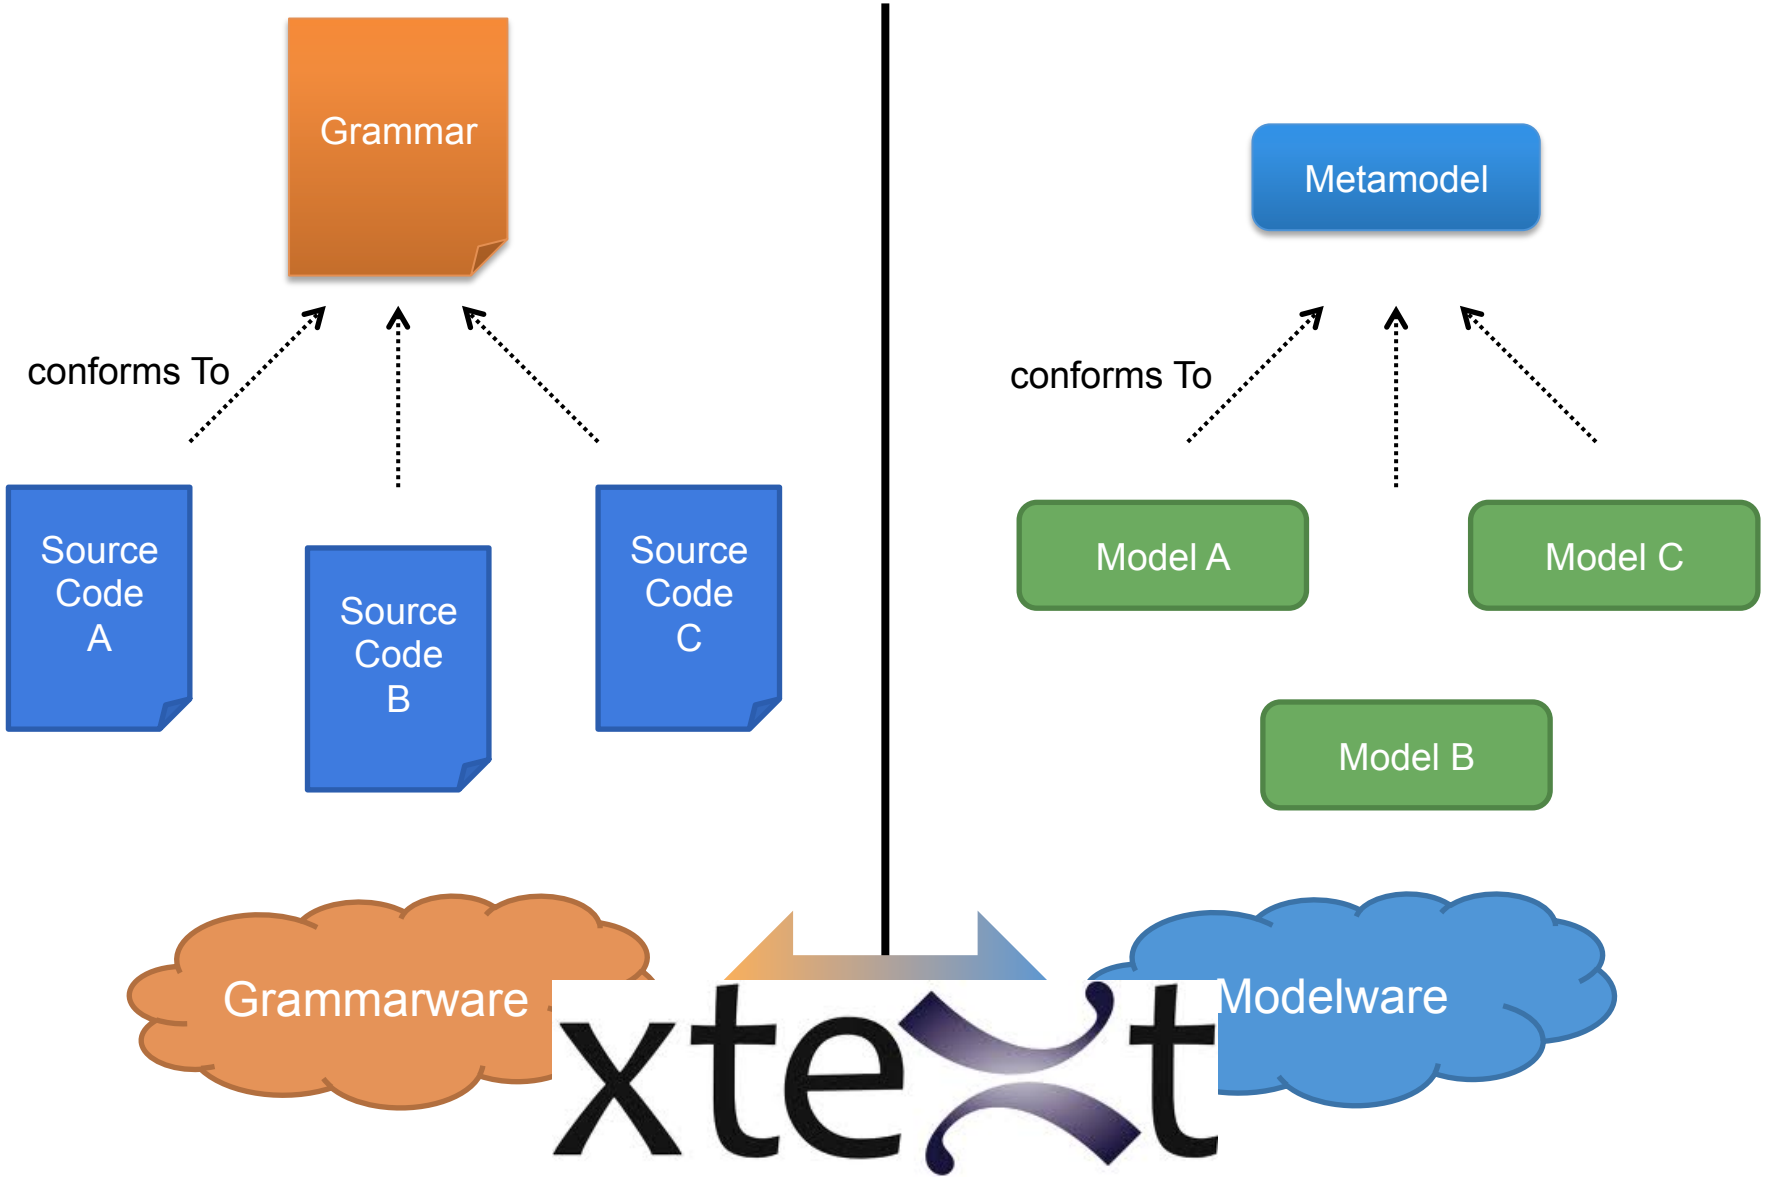
Model

Language and MDE



Give me a **grammar**,

I'll give you (for free)
 * a comprehensive editor (auto-completion, syntax highlitening, etc.) in Eclipse
 * an Ecore metamodel and facilities to load/serialize/visit conformant models (Java ecosystem)
 * extension to override/extend « default » facilities (e.g., checker)

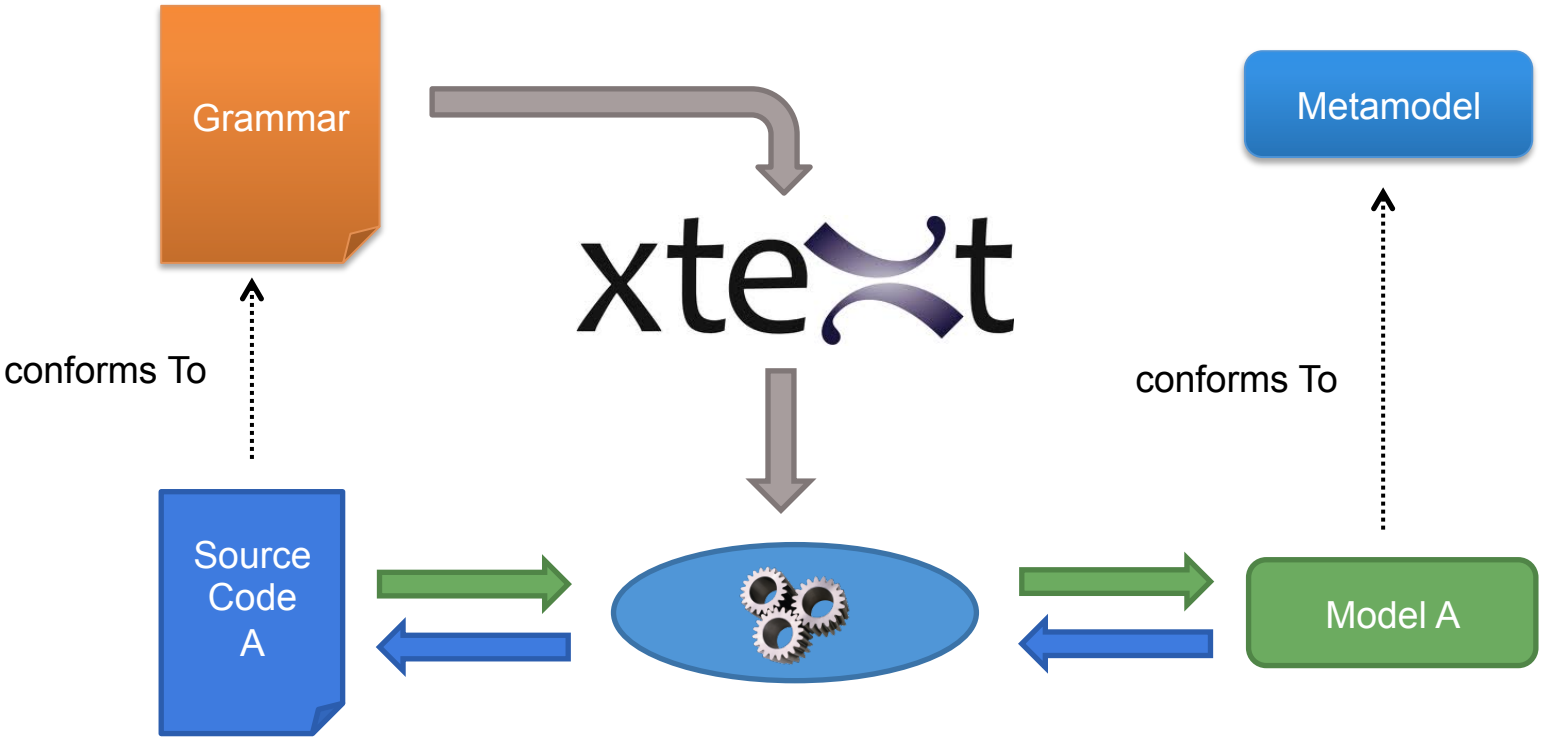
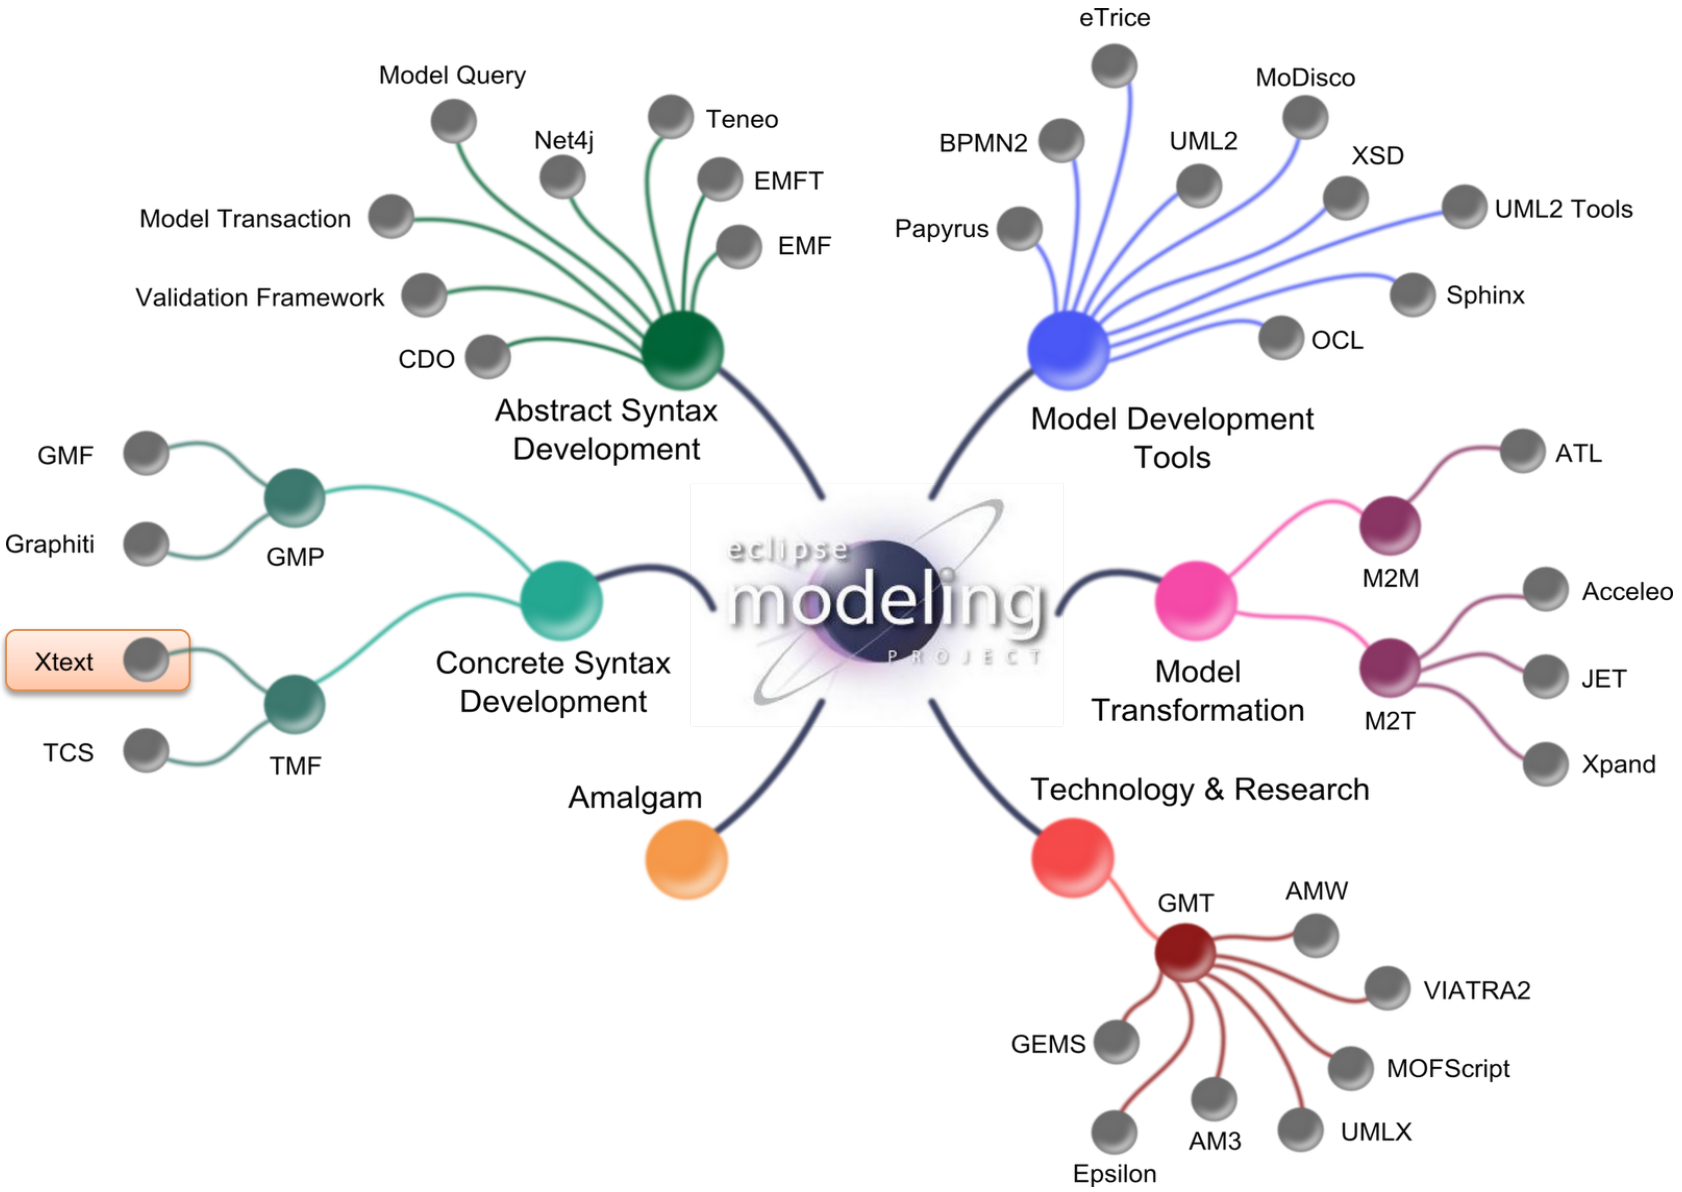
Xtext, Grammar, Metamodel



Xtext Project

- Eclipse Project
  - Part of Eclipse Modeling
  - Part of Open Architecture Ware
- Model-driven development of Textual DSLs
- Part of a family of languages
  - **Xtext**
  - Xtend
  - Xbase
  - Xpand
  - Xcore

Eclipse Modeling Project



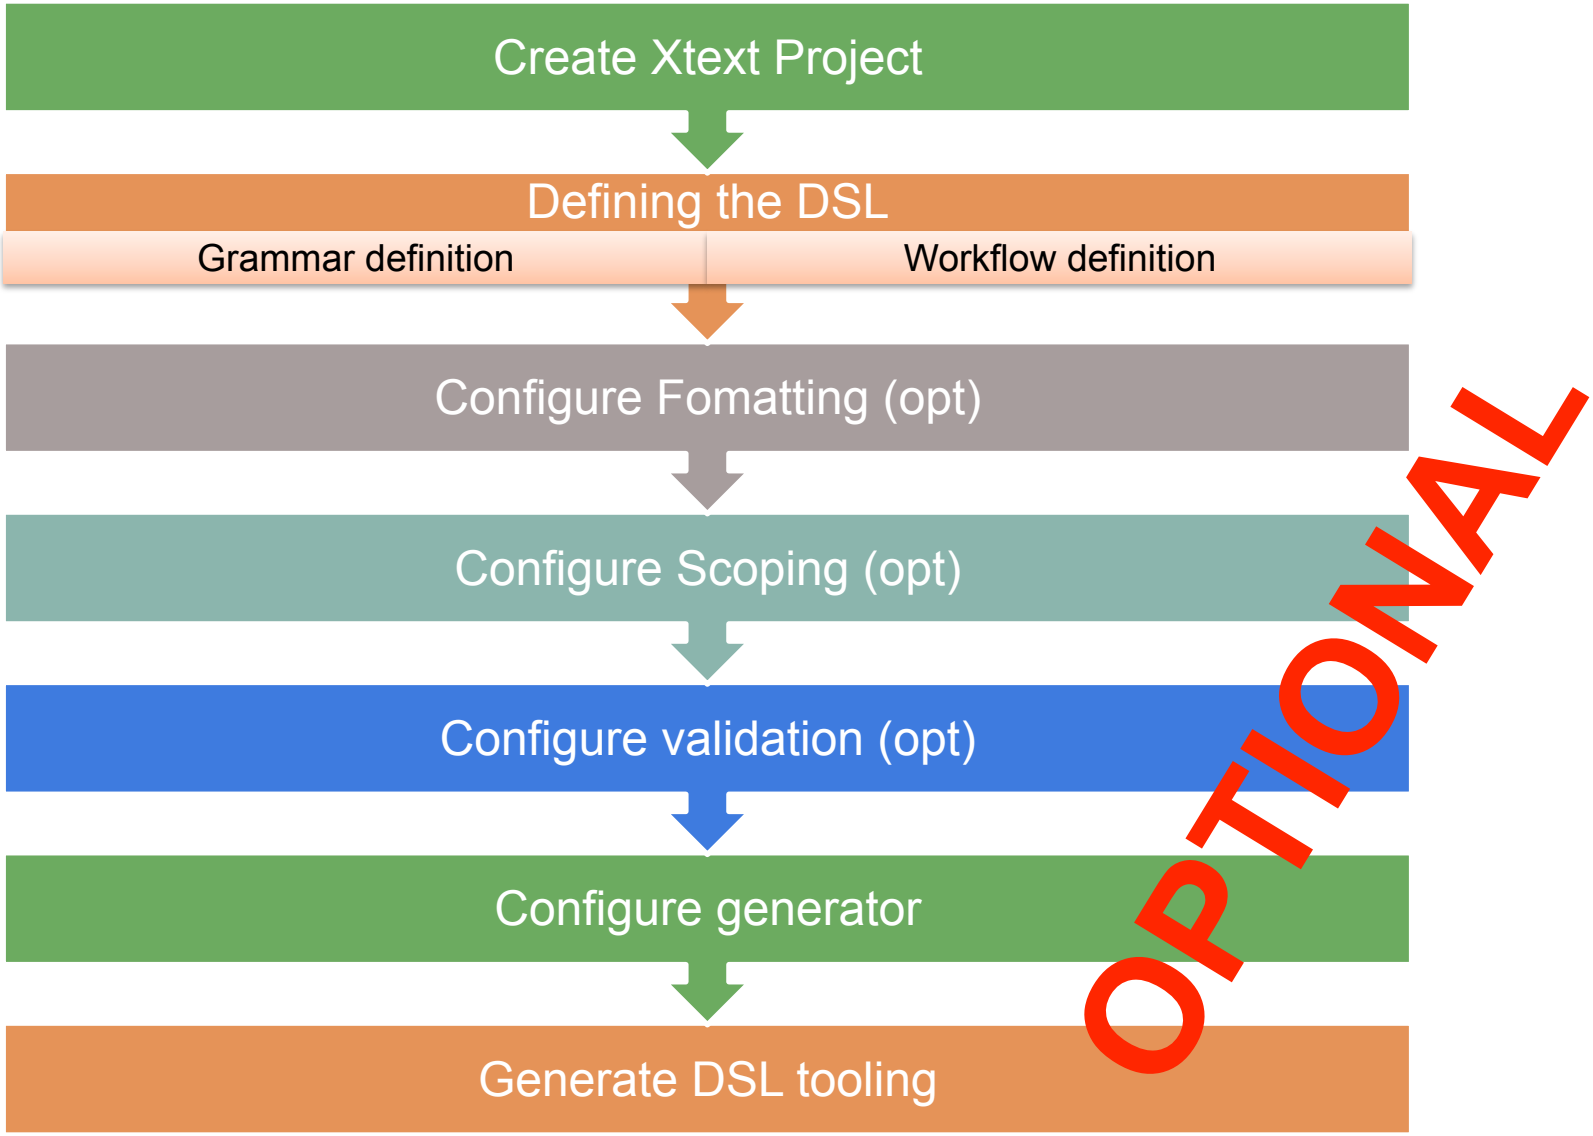
The Grammar Language of Xtext

- Corner-stone of Xtext
- A… DSL to define textual languages
  - Describe the concrete syntax
  - Specify the mapping between concrete syntax and domain model
- From the grammar, it is generated:
  - The domain model
  - The parser
  - The tooling

Main Advantages

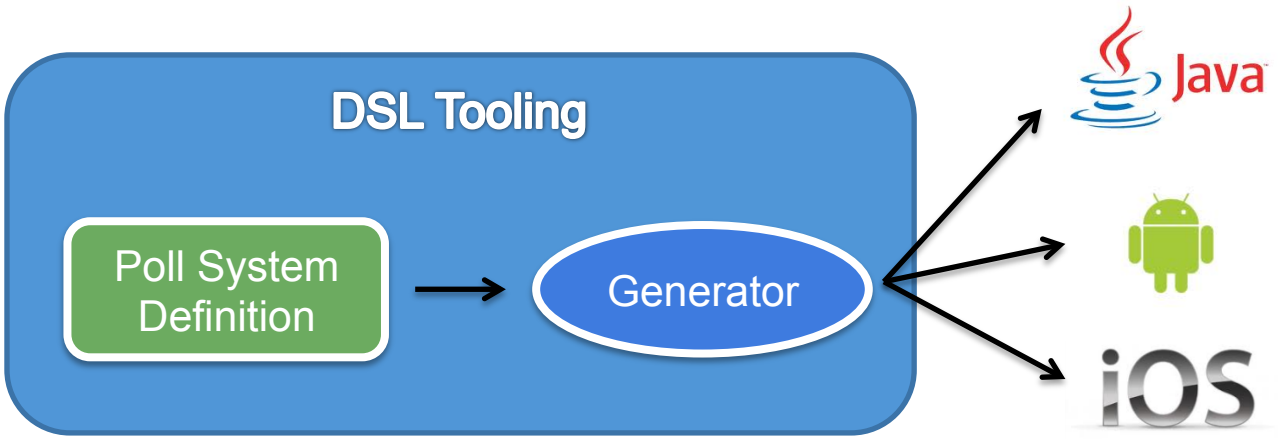
- Consistent look and feel
- Textual DSLs are a resource in Eclipse
- Open editors can be extended
- Complete framework to develop DSLs
- Easy to connect to any Java-based language

Development Process



Motivating Scenario

- Poll System application
  - Define a Poll with the corresponding questions
  - Each question has a text and a set of options
  - Each option has a text
- Generate the application in different platforms



Motivating Scenario (2)

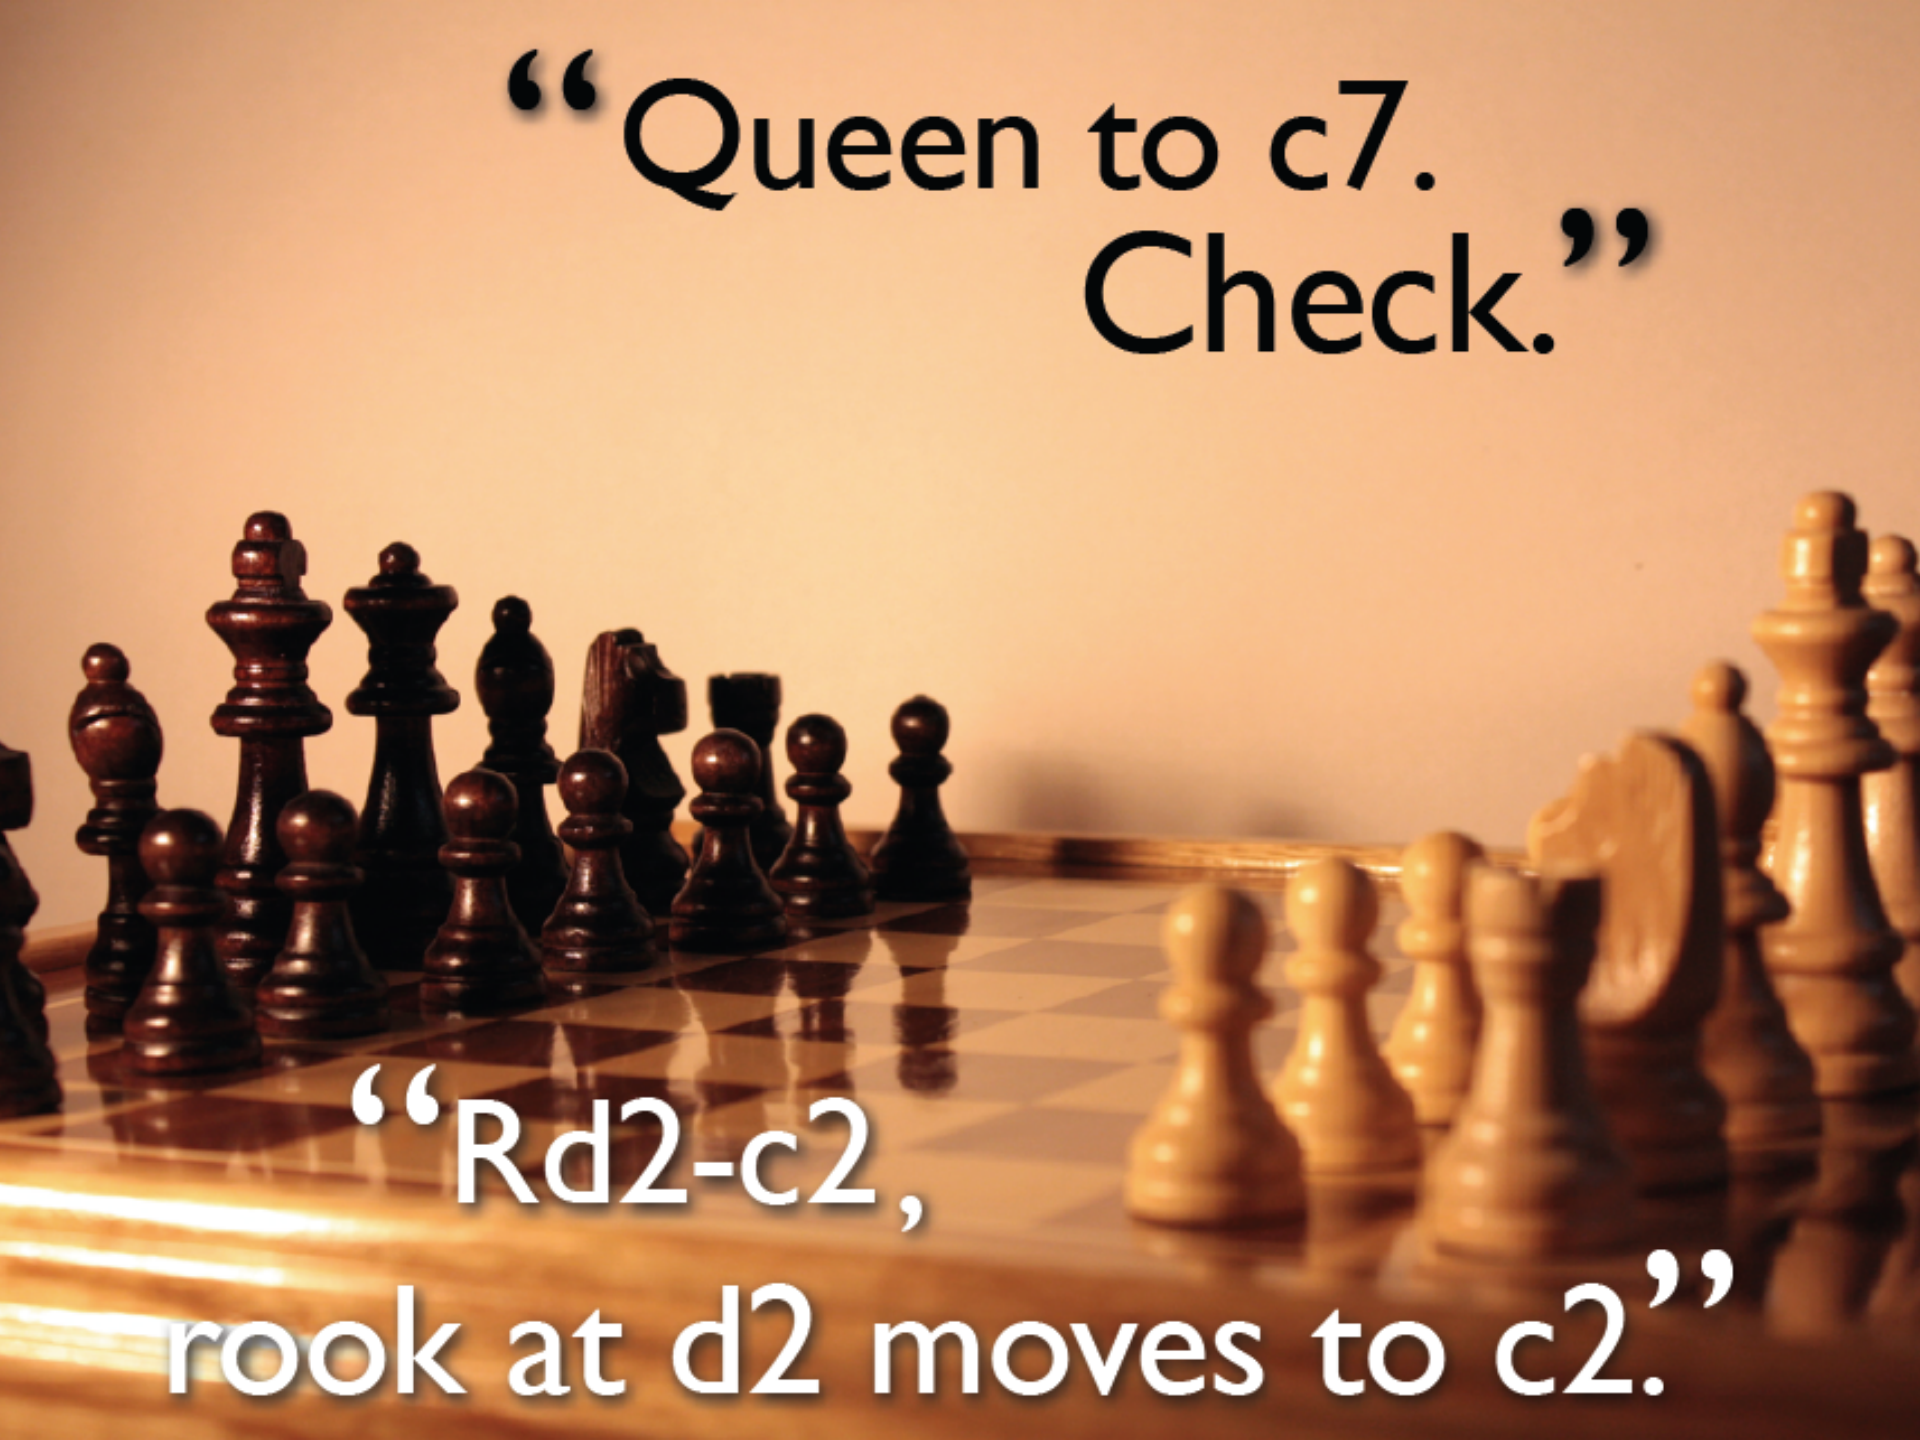
                Question {
                        "Q1"
                        options o1 : "R1"
                }
        }
}
```

Xtext, your DSL in 5' (incl. editors and serializers)

Live Demonstration

Another example:

Chess



“Queen to c7.
Check.”
“Rd2-c2,
rook at d2 moves to c2.”

Moves in Chess:

Rook at a1 moves to a5.

Piece Square Action Destination

Bishop at c8 captures knight at h3.

Piece Square Action Destination

N b1 x c3

Piece Square Action Destination

g2 - g4

Square Action Destination

Bishop at c8 captures knight at h3

B c8 x h3

P e2 – e4

p g7 – g5

Knight at b2 moves to c3

pawn at f7 moves to f5

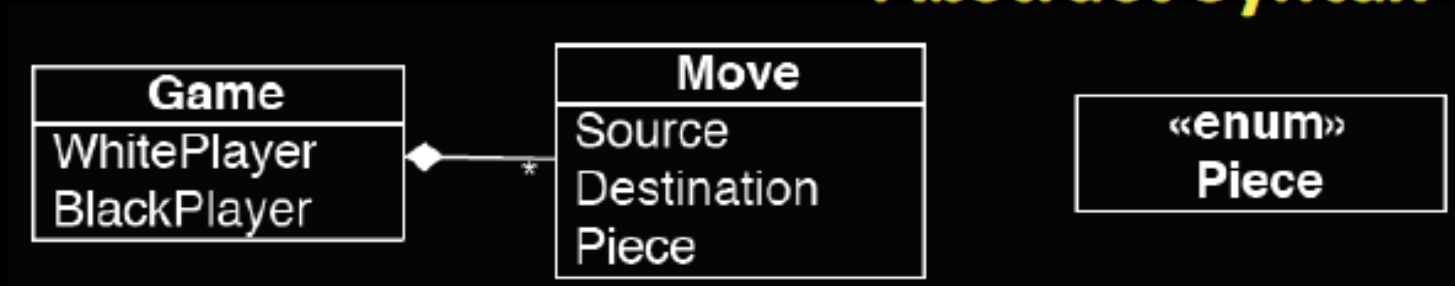
Q d1 – h5

1-0

Concrete Syntax

Constraints !!!

Abstract Syntax



Chess Example - Grammar

```
Game:
 "White:" whitePlayer=STRING
 "Black:" blackPlayer=STRING
 (moves+=Move)+;

Move:
 AlgebraicMove | SpokenMove;
AlgebraicMove:
 (piece=Piece)? source=Square (captures?='x'|'-') dest=Square;

SpokenMove:
 piece=Piece 'at' source=Square
 (captures?='captures' capturedPiece=Piece 'at' | 'moves to')
 dest=Square;

terminal Square:
 ('a'..'h')('1'..'8');

enum Piece:
 pawn   = 'P' | pawn = 'pawn' |
 knight = 'N' | knight = 'knight' |
 bishop = 'B' | bishop = 'bishop' |
 rook   = 'R' | rook = 'rook' |
 queen  = 'Q' | queen = 'queen' |
 king   = 'K' | king = 'king';
```

Chess Example - Model

White: "Mayfield"
Black: "Trinks“

pawn at e2 moves to e4
pawn at f7 moves to g5

K b1 - c3
f7 - f5

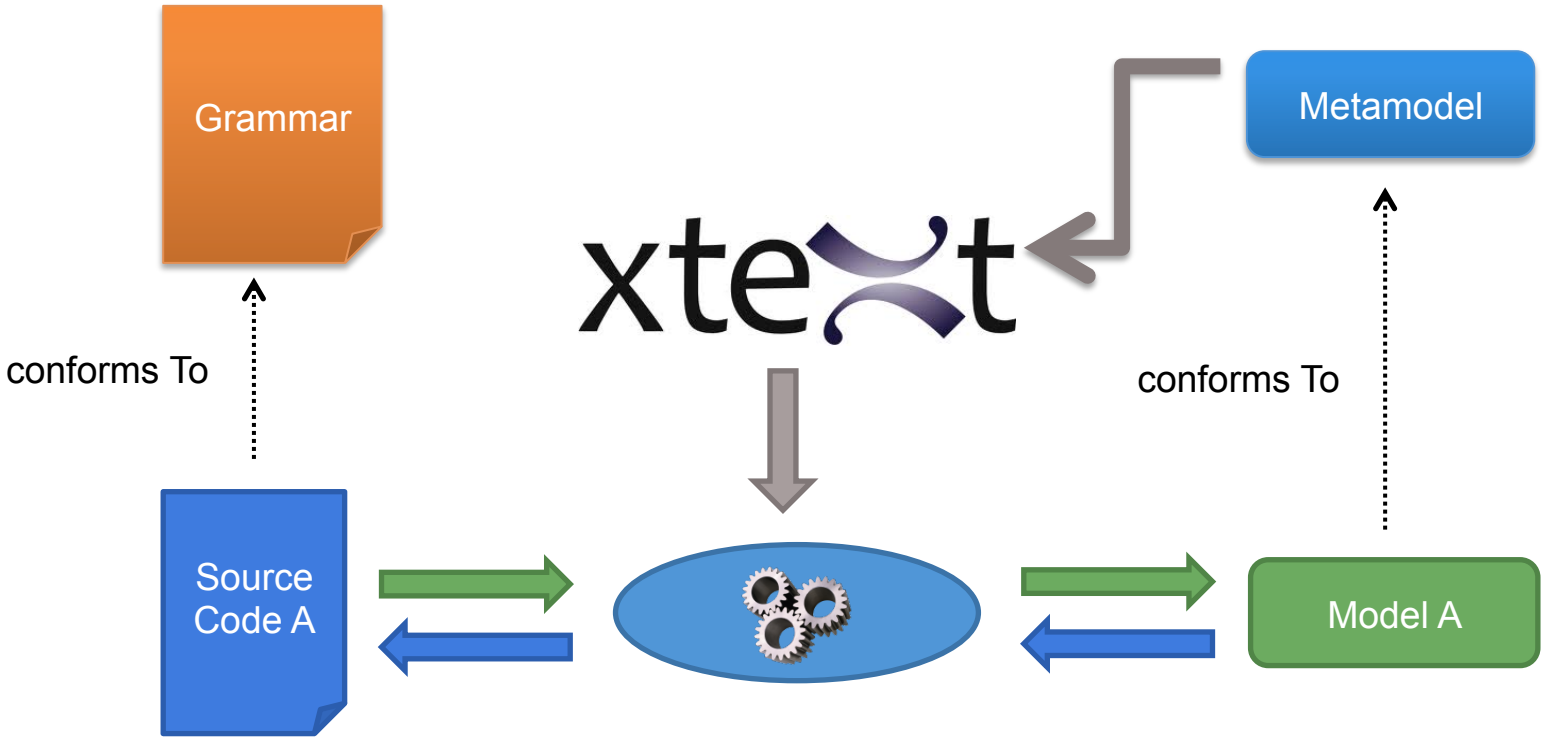
queen at d1 moves to h5
// 1-0

From Metamodel

To

Grammar (other side)

From Metamodel to Grammar



Give me a **metamodel**,

I'll give you (for free)
 * a comprehensive editor (auto-completion, syntax highlitening, etc.) in Eclipse
 * a grammar and facilities to load/serialize/visit conformant models (Java ecosystem)
 * extension to override/extend « default » facilities (e.g., checker)

Give me a **metamodel**,

The grammar can be « weird » (i.e., not as concise and as comprehensible than if you made it manually)

[Same observation actually applies to the other side: generated metamodels (from grammar) can be weird as well, but you have at least some control in Xtext-based grammar]
[We will experiment in the lab sessions]

Live

Demonstration

Graphical DSL

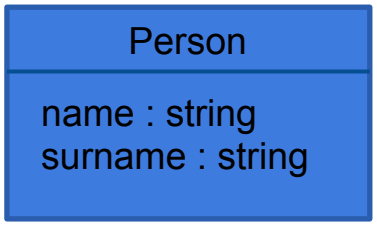
(vs Textual DSL)

Graphical vs Textual DSLs

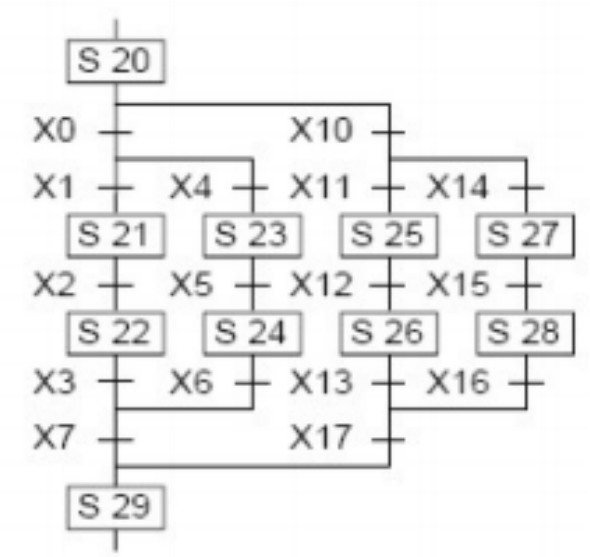
- Success depends on how the notation fits the domain

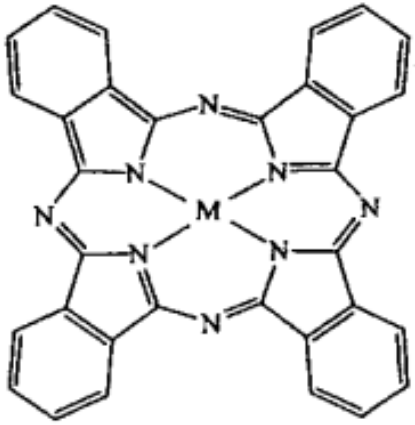
```
class Person {
  private String name;
  private String name;
}
```

```
Person has (name, surname)
```



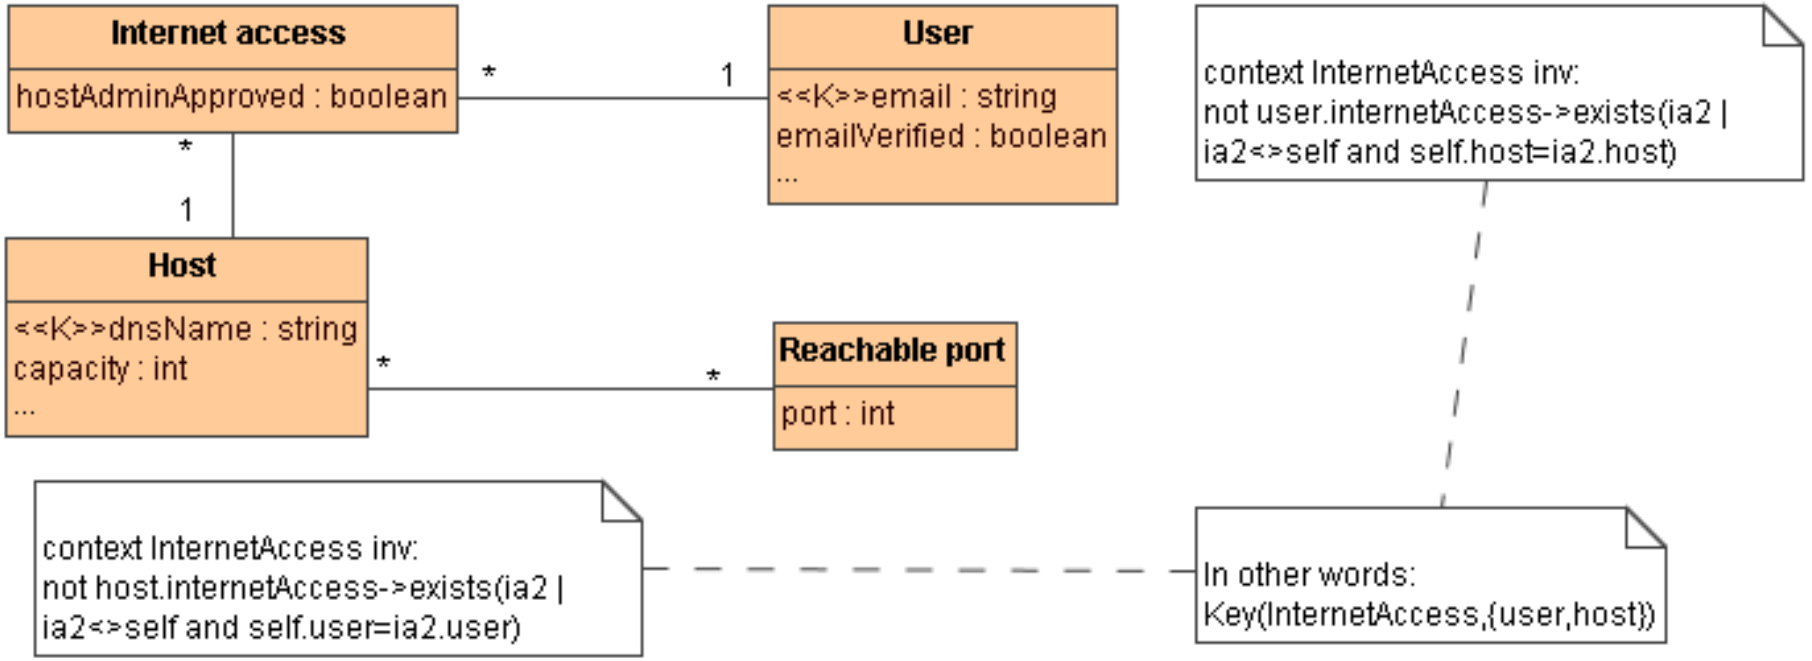
- Graphical DSLs are not always easier to understand





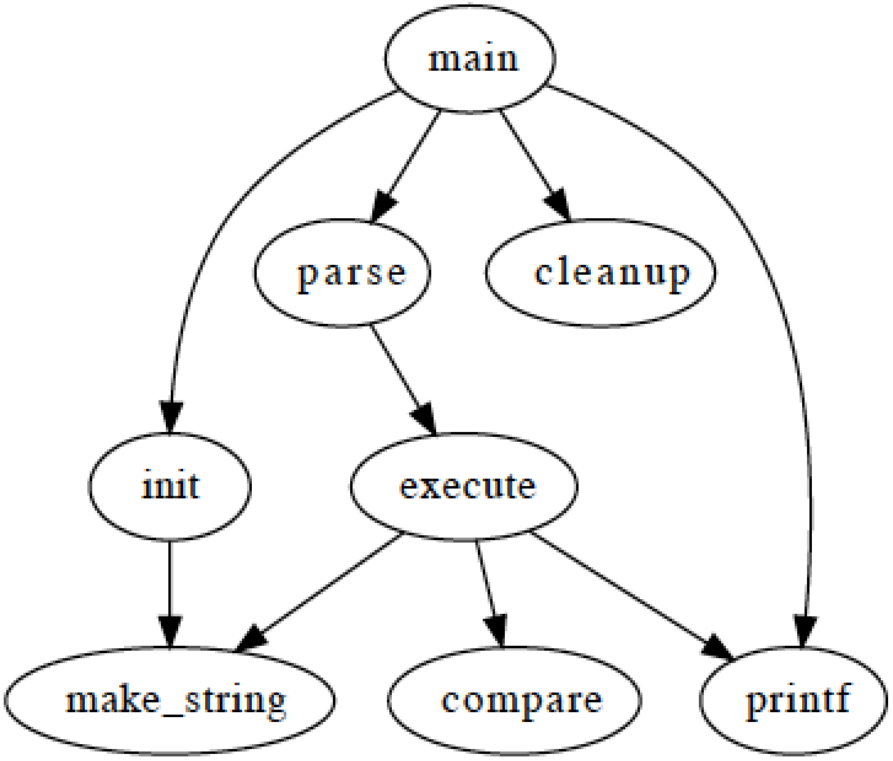
phthalocyanine

A language can be graphical and textual



Alternative representation

```
digraph G {
main -> parse -> execute;
main -> init;
main -> cleanup;
execute -> make_string;
execute -> printf
init -> make_string;
main -> printf;
execute -> compare;
 }
```



Recommendations for Graphical DSLs

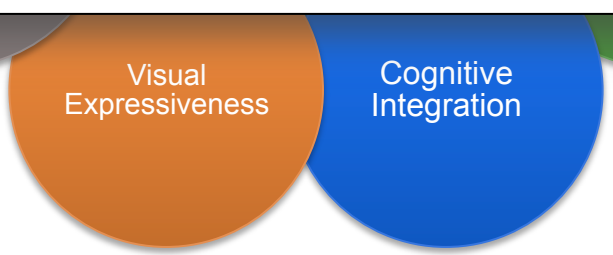
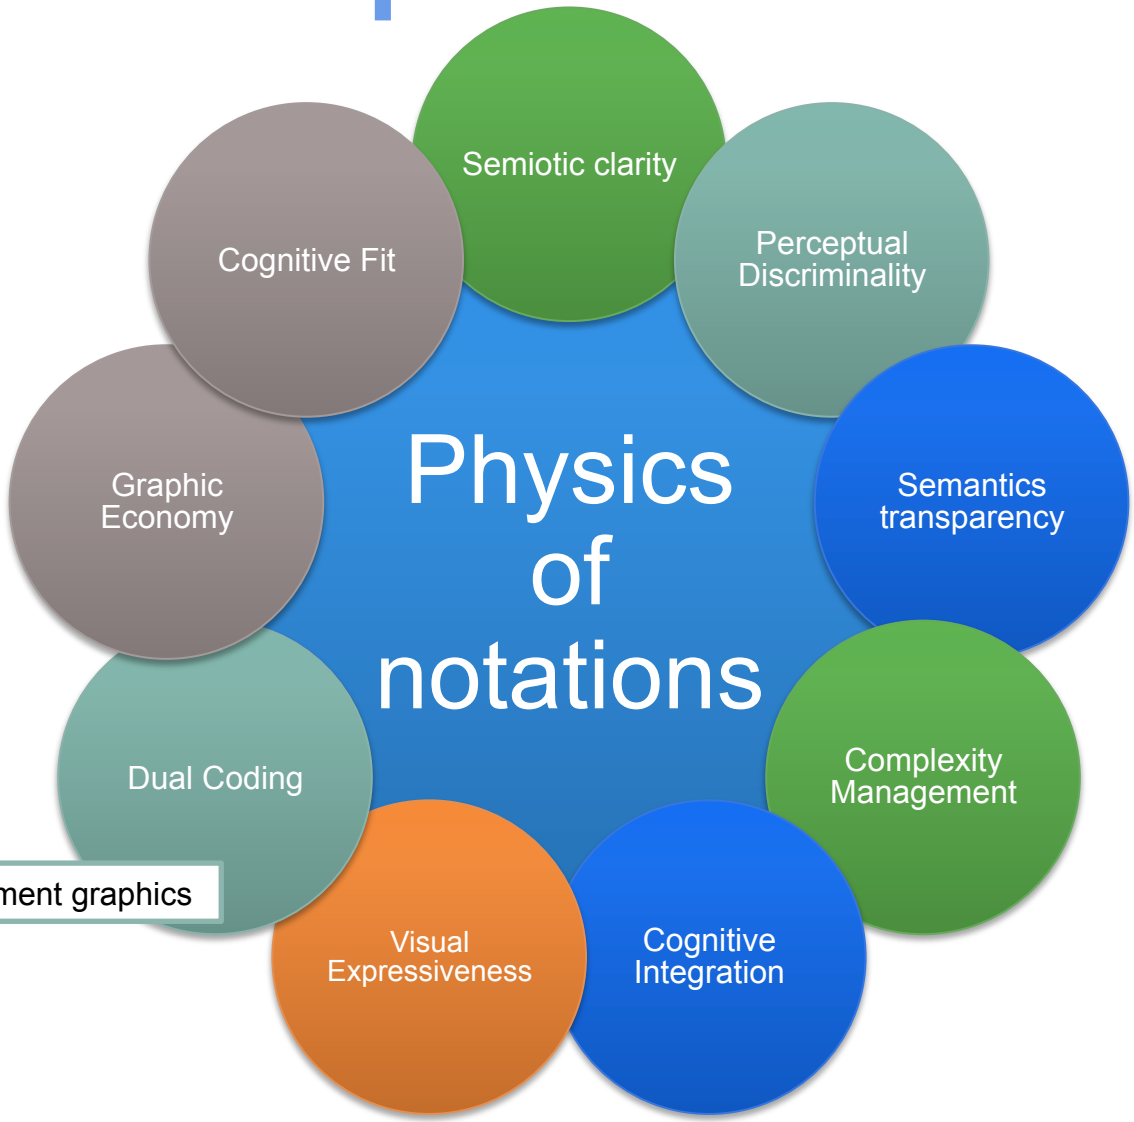
Package				●		●		
Sequence	●					●		
State machine				●		●		
Timing	●	●						
Use case	●					●		

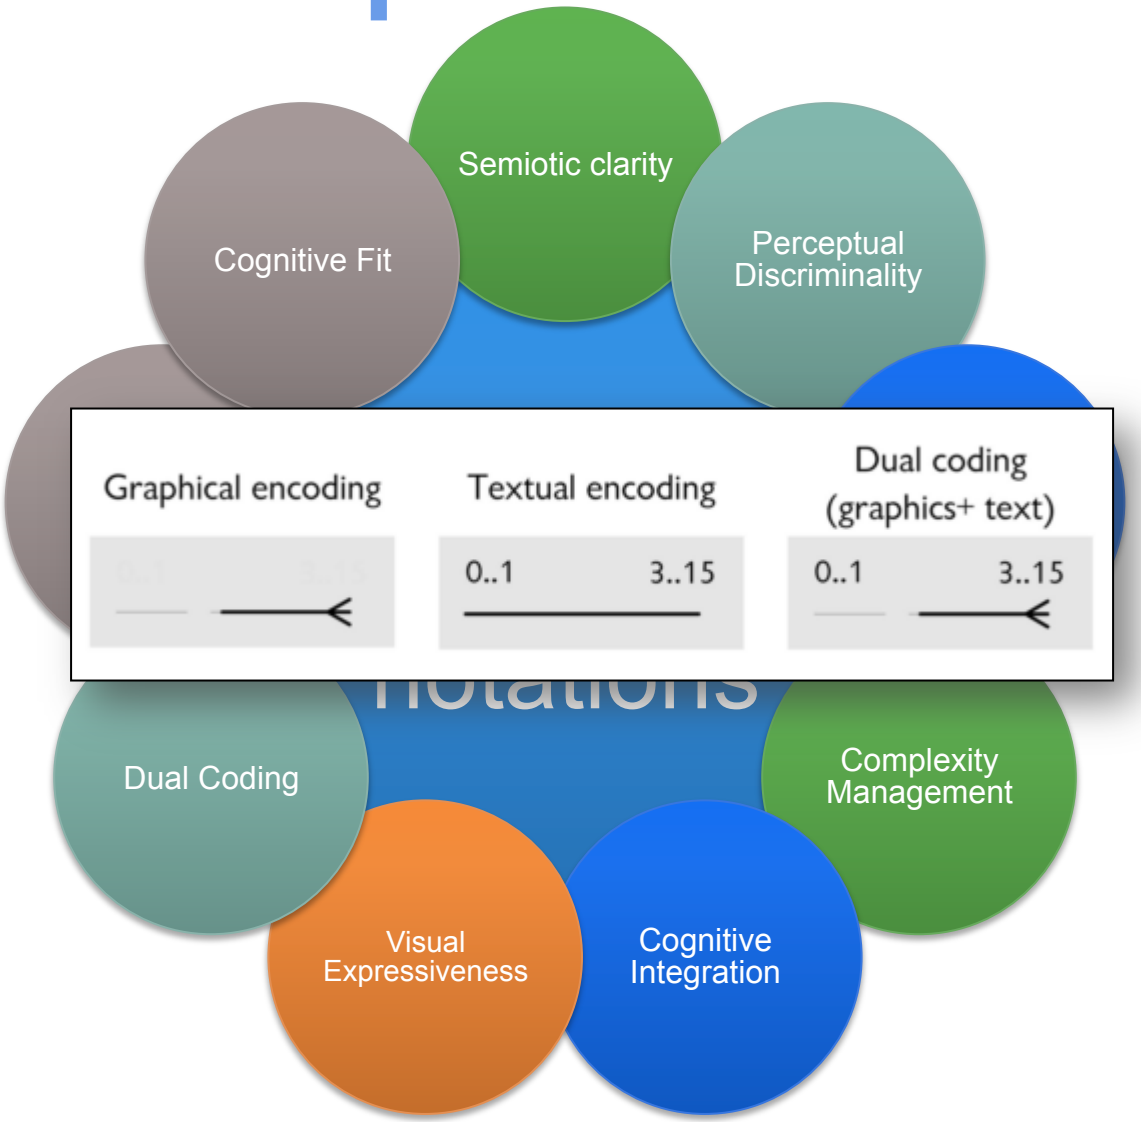


Recommendations for Graphical DSLs

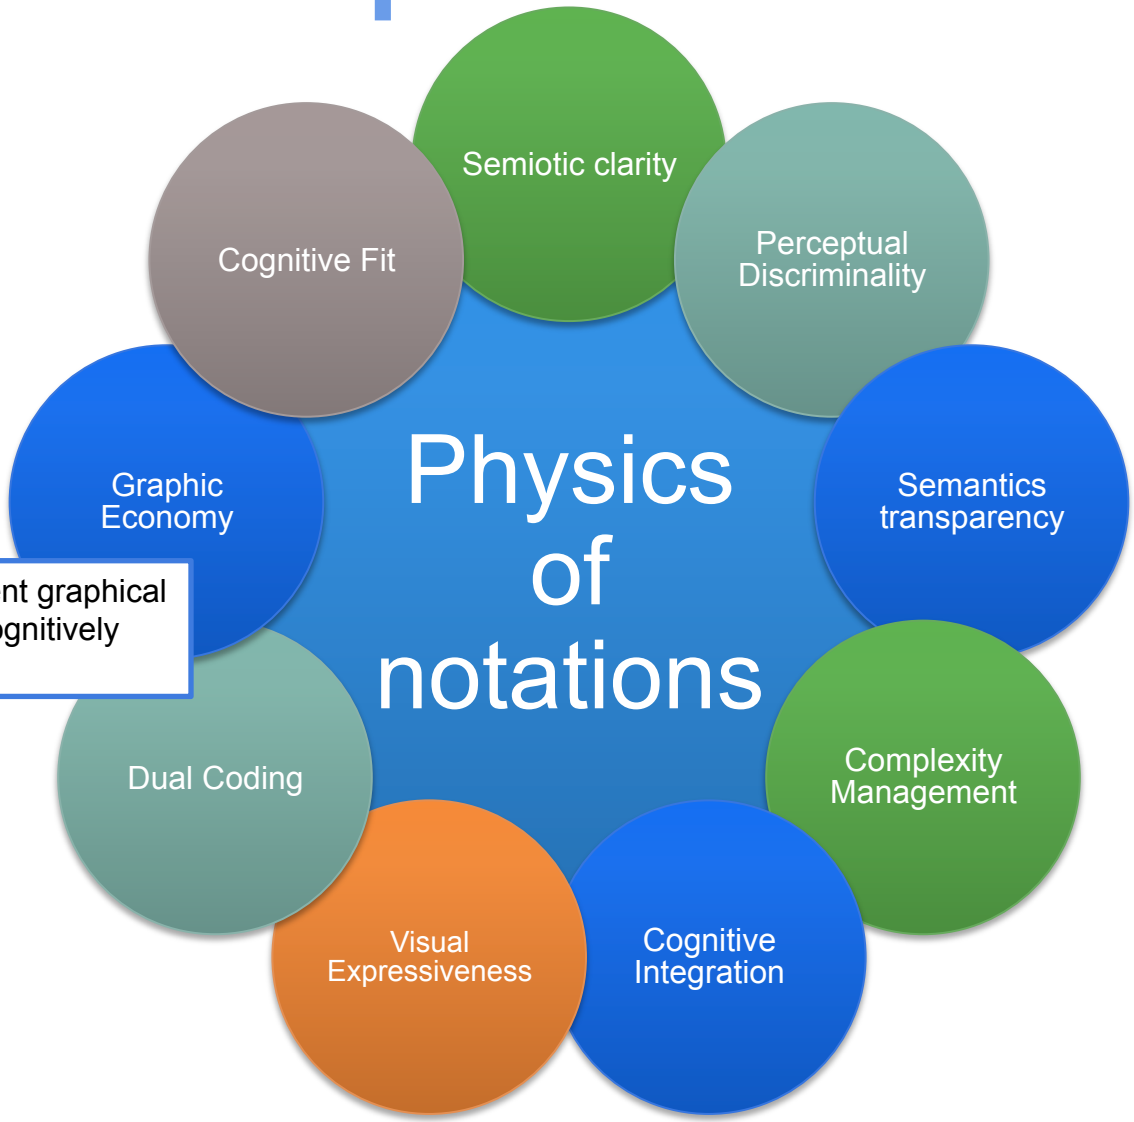


Use text to complement graphics

Recommendations for Graphical DSLs



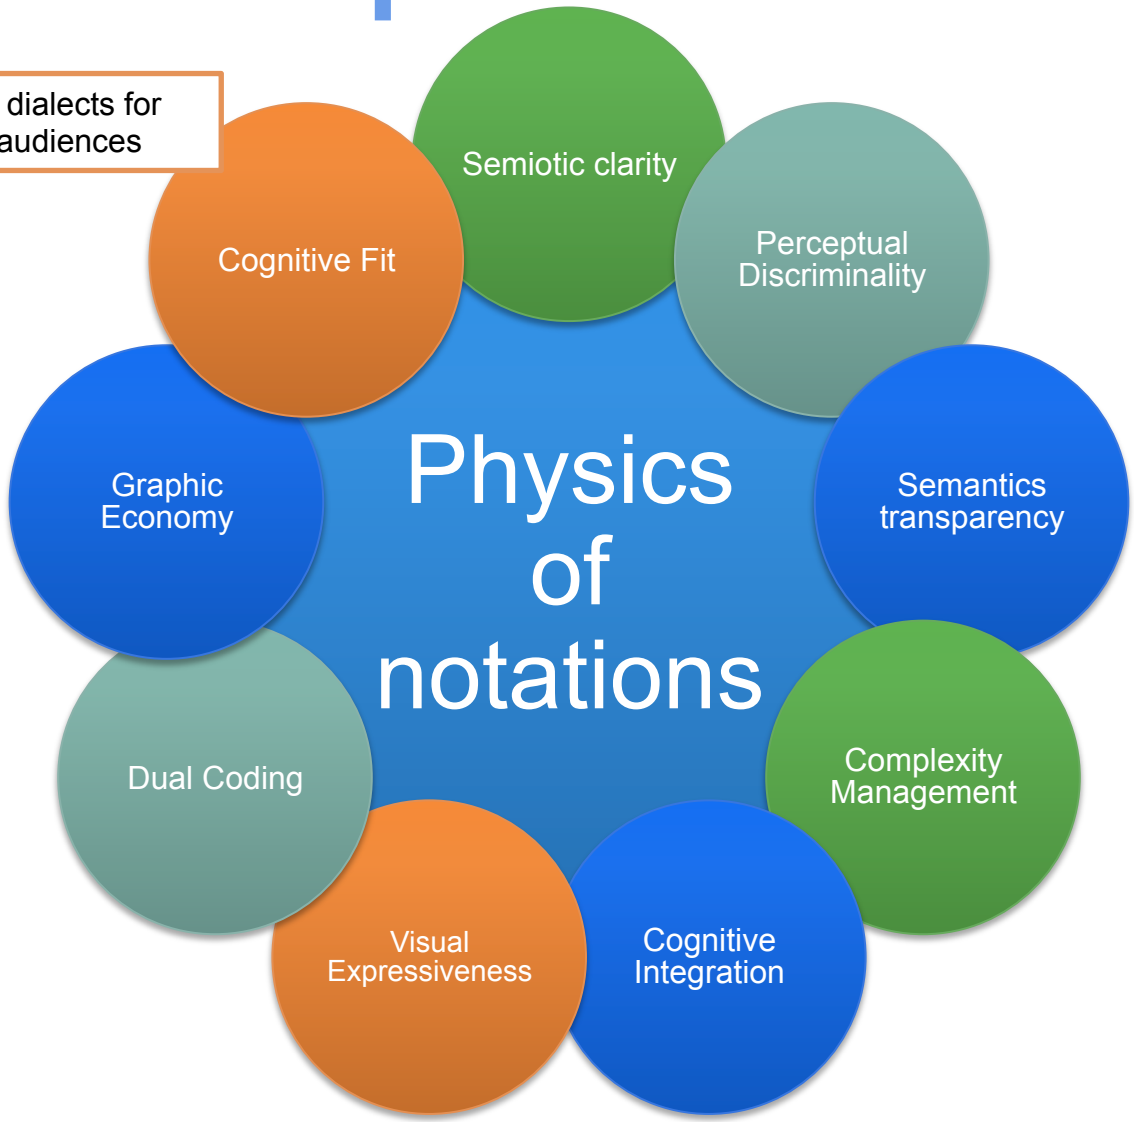
Recommendations for Graphical DSLs



The number of different graphical symbols should be cognitively manageable

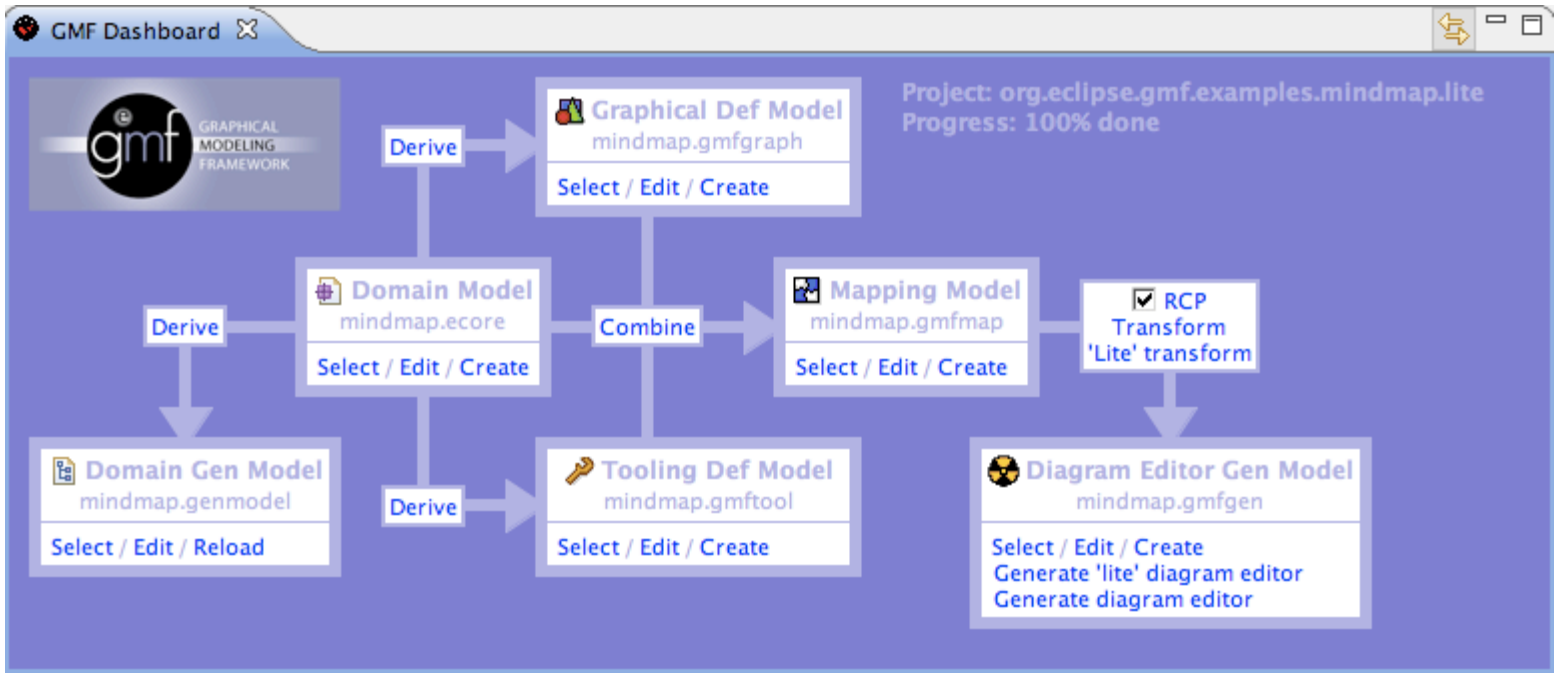
Recommendations for Graphical DSLs

Use different visual dialects for different tasks and audiences

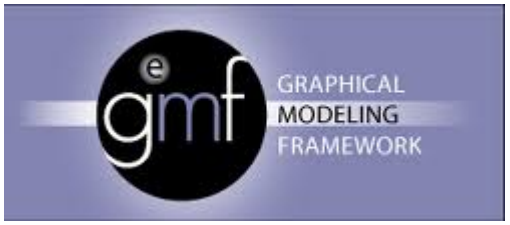


Graphical Modeling Framework (GMF)

- Model-Driven Framework to develop graphical editors based on EMF and GEF
- GMF is part of Eclipse Modeling Project
- Provides a generative component to create the DSL tooling
- Provides a runtime infrastructure to facilitate the development of graphical DSLs

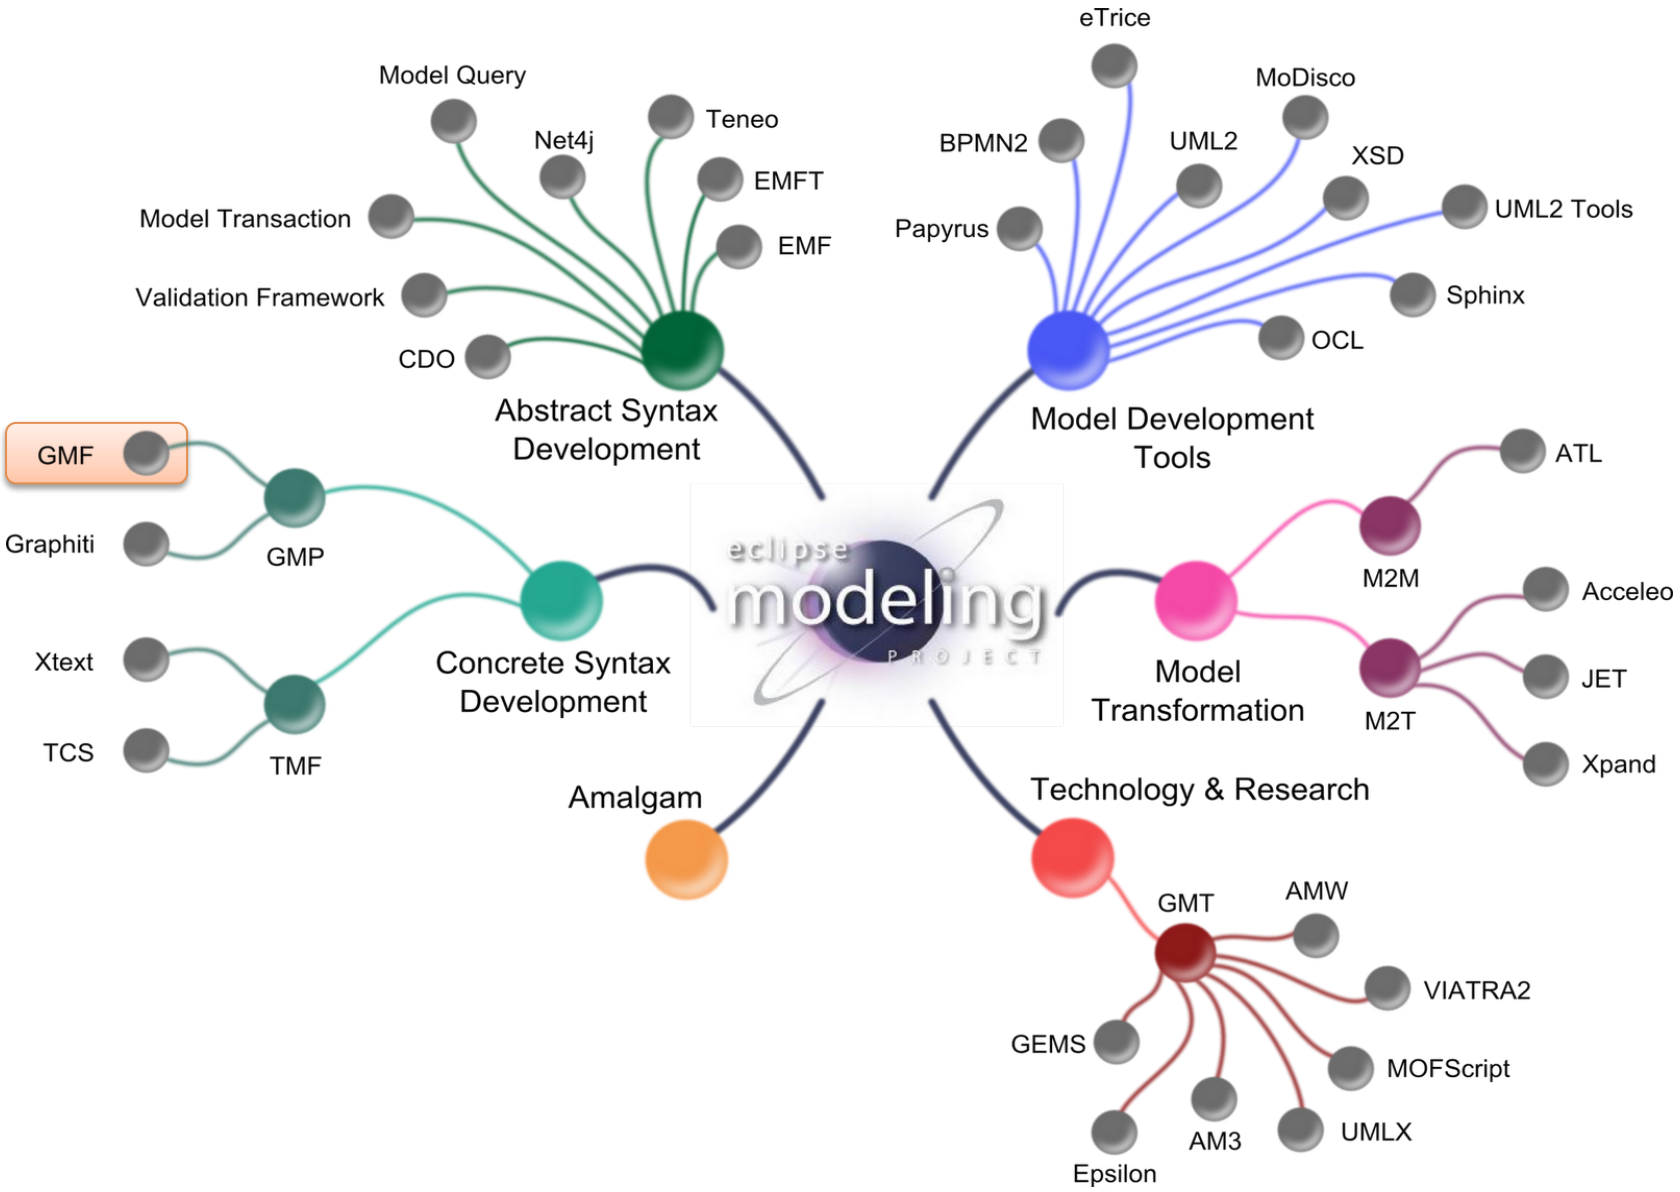


GMF



- Eclipse project
  - Eclipse Modelling components
  - Uses
    - EMF (Eclipse Modeling Framework)
    - GEF (Graphical Editing Framework)
- Model-driven framework for Graphical DSLs
  - Everything is a model
- DSL definition easy, tweaking hard

Eclipse Modeling Project



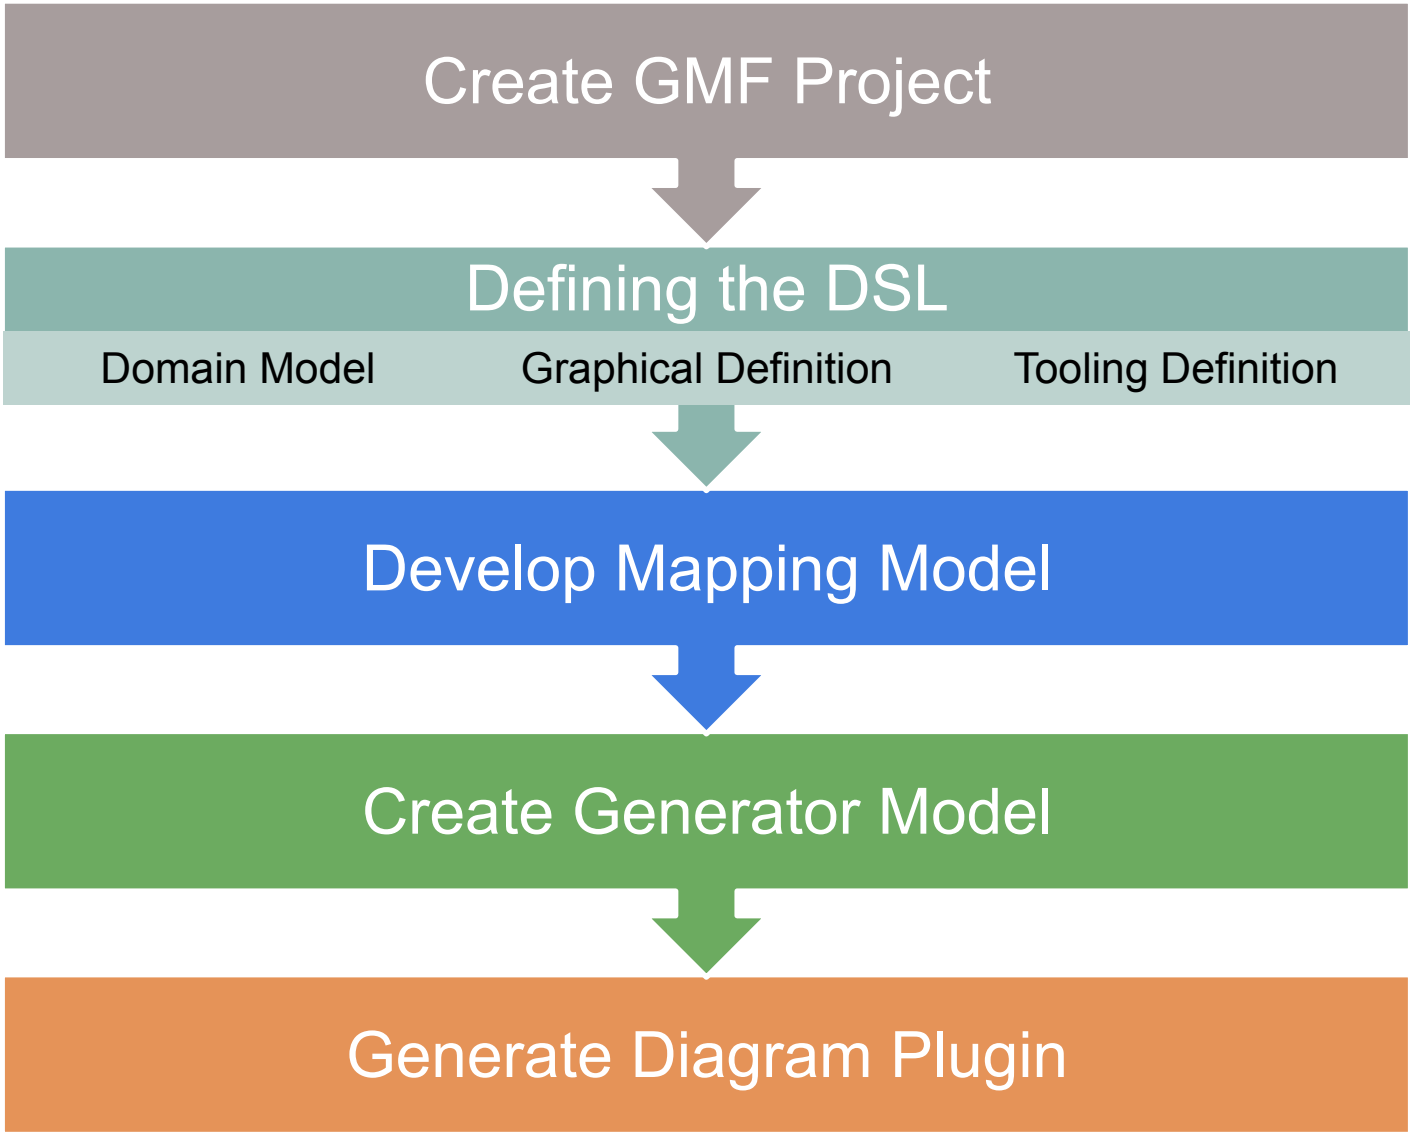
GMF features

- Tooling
  - Editors for notation, semantic and tooling
  - GMF Dashboard
  - Generator to produce the DSL implementation
- Runtime
  - Generated DSLs depend on the GMF Runtime to produce an extensible graphical editor

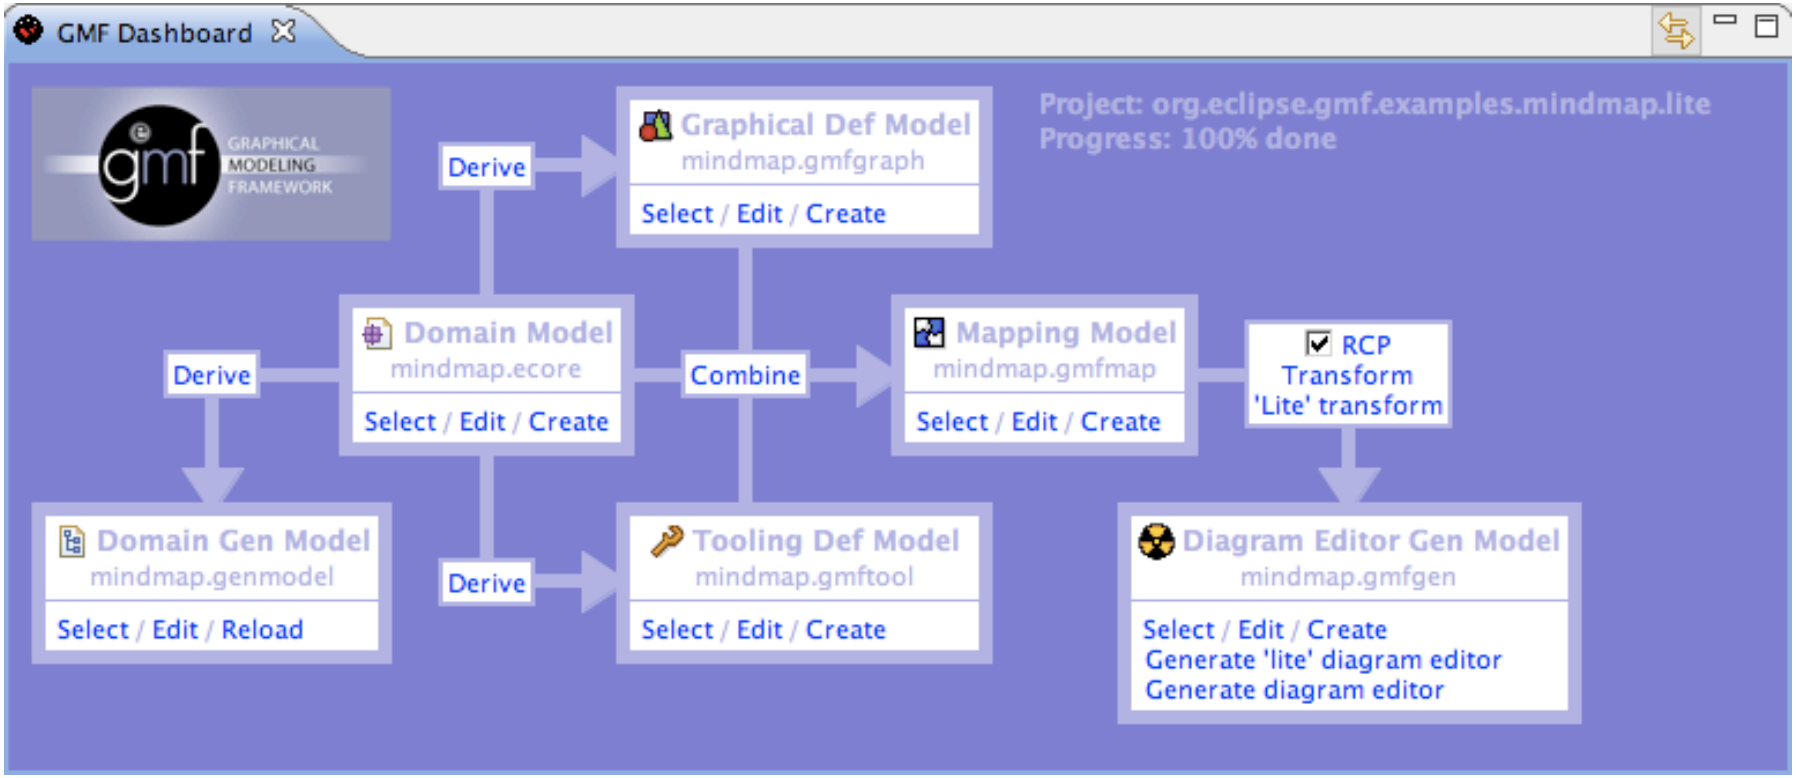
Main Advantages

- Consistent look and feel
- Diagram persistence
- Open editors can be extended by third-parties
- Already integrated with various Eclipse components
- Extensible notation metamodel to enable the isolation of notation from semantic concerns
- Future community enhancements will easily be integrated

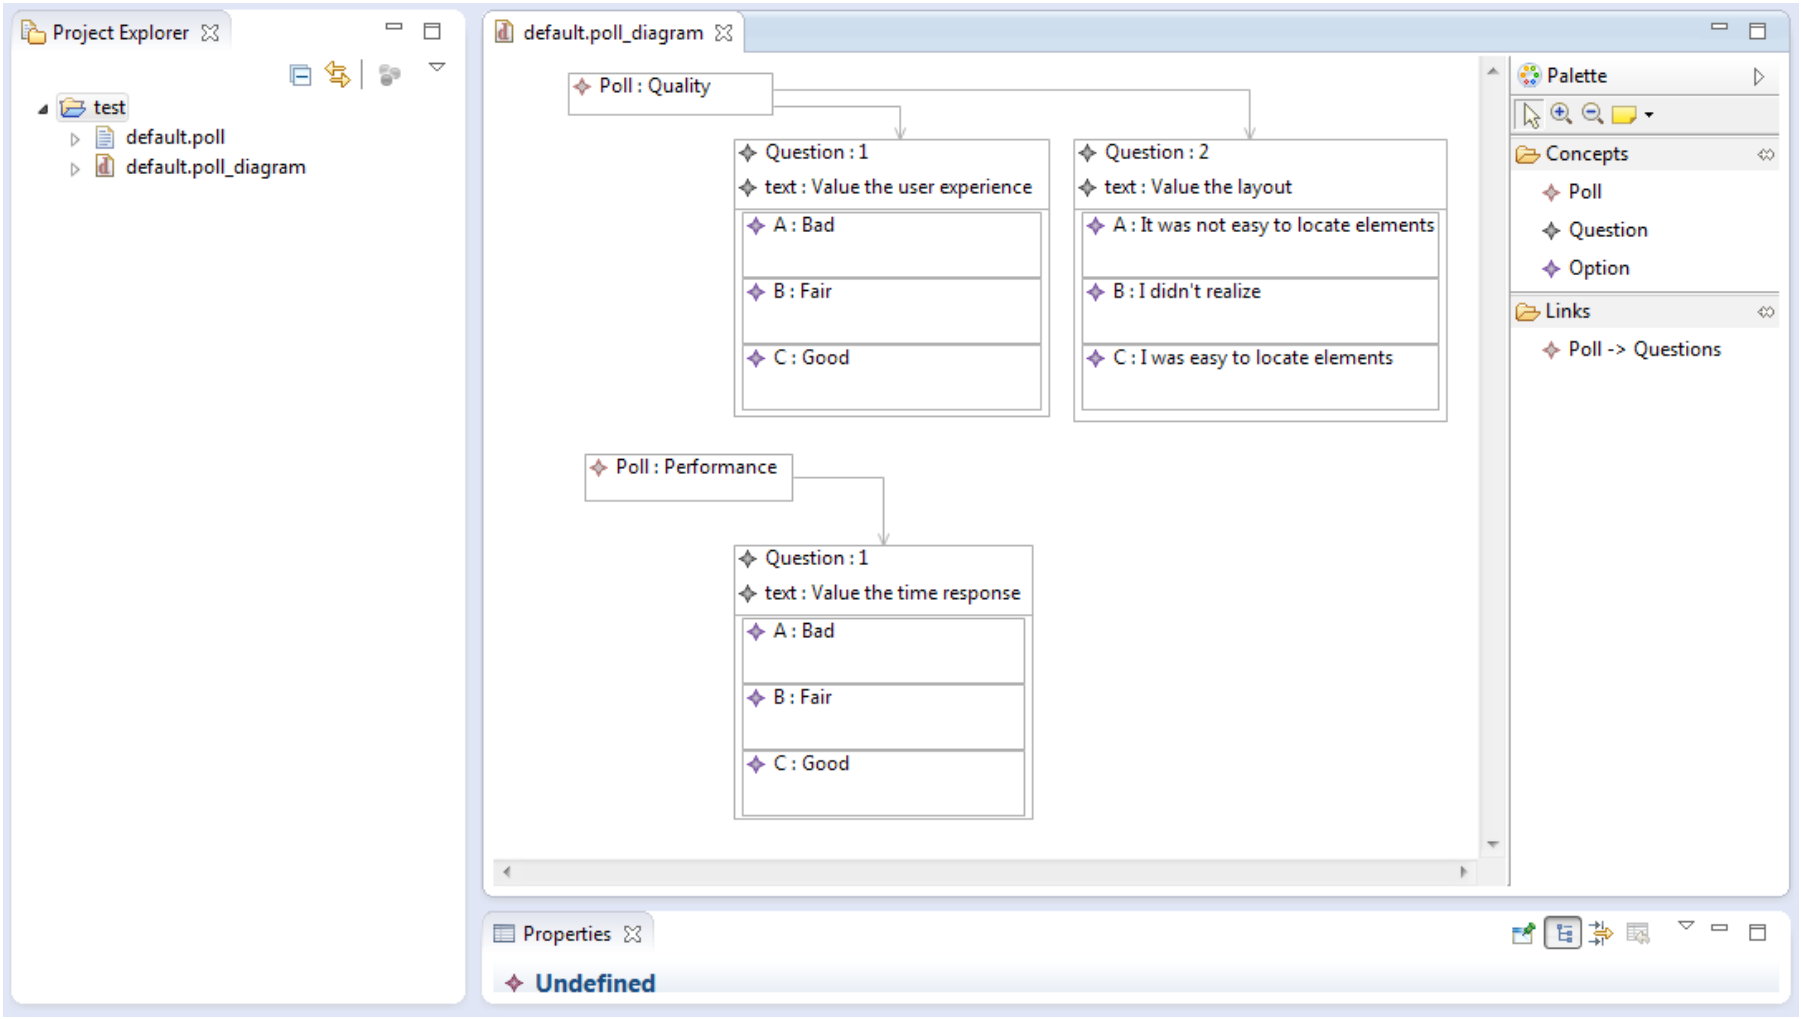
Development Process



Development Process

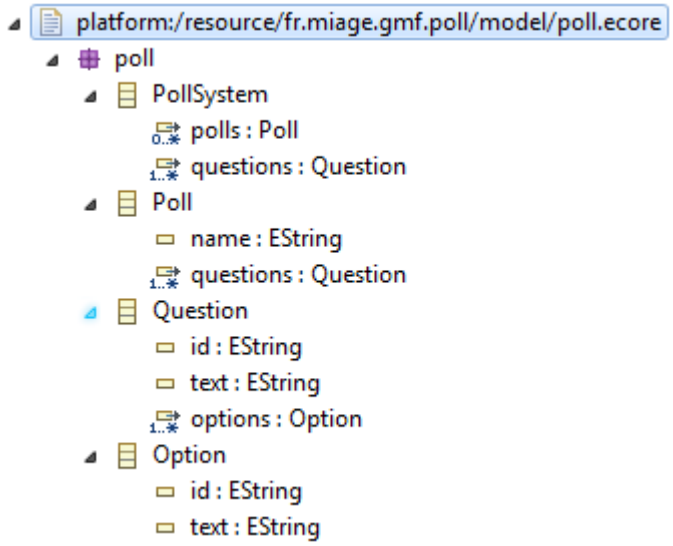


Example (Graphical Notation)



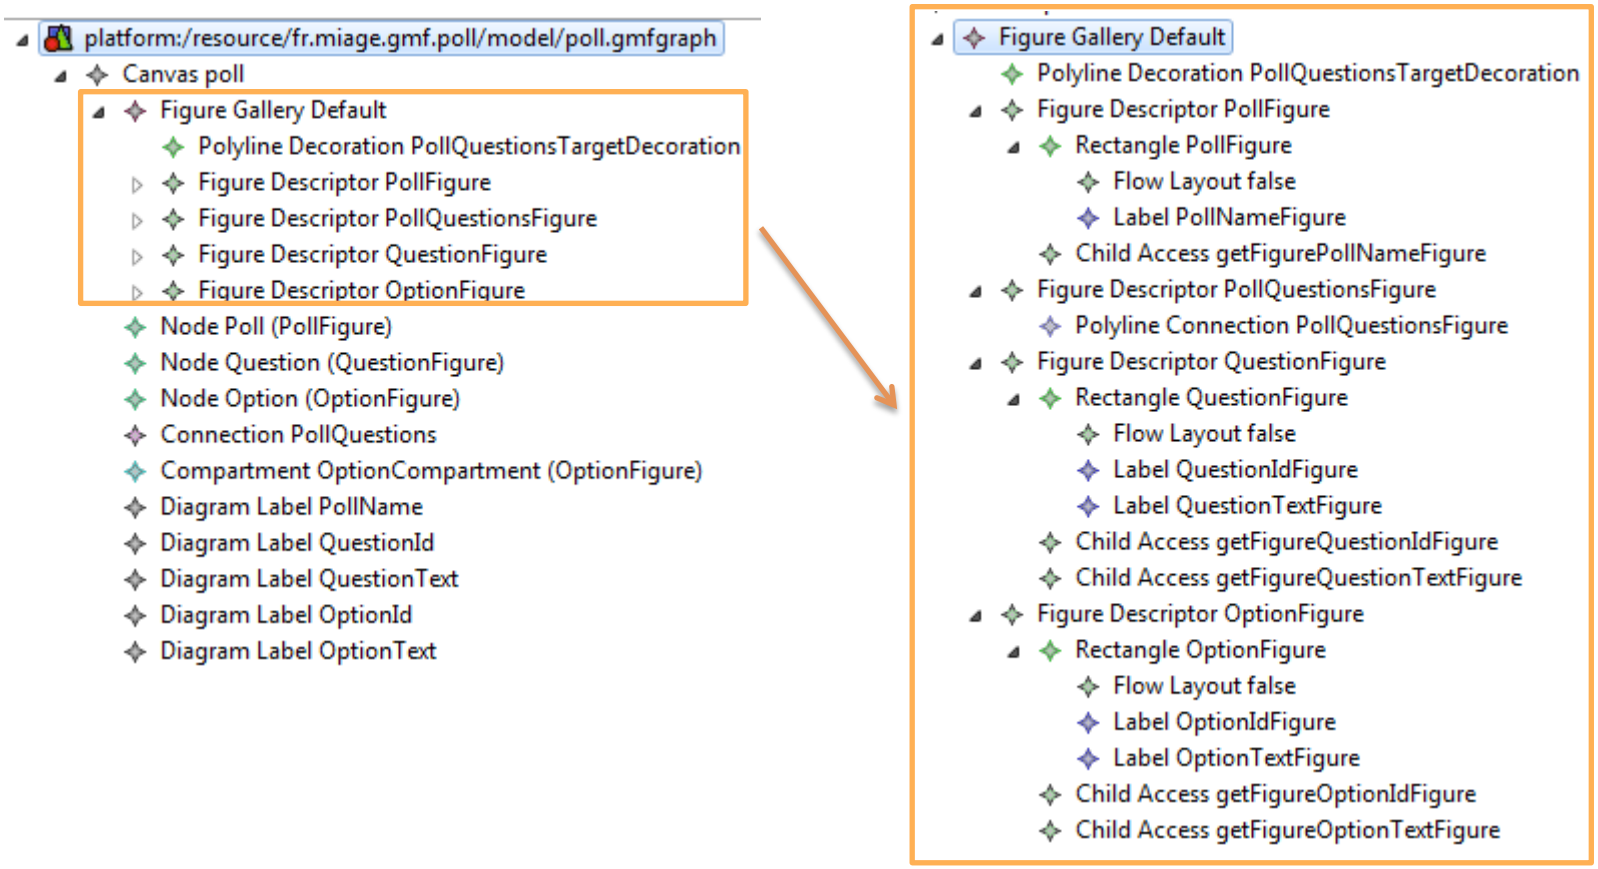
Poll System Metamodel

- Concepts
  - PollSystem
  - Poll
  - Question
  - Option
- Attributes
  - A Poll has a name
  - A Question has an identifier and a descriptive text
  - An Option has an identifier and a descriptive text
- Relationships
  - PollSystem is composed of polls and questions
  - Question has a set of options



Graphical Definition

- A model will represent a PollSystem
- A Poll will be a node
- A Question will be a rectangular node
- An Option will be a rectangular node included in the Question node



Plan

- Domain-Specific Languages (DSLs)
  - Languages and abstraction gap
  - Examples and rationale
  - DSLs vs General purpose languages, taxonomy
- External DSLs
  - Grammar and parsing
  - Xtext
- DSLs, DSMLs, and (meta-)modeling

Contract

- Better understanding/source of inspiration of software languages and DSLs
  - Revisit of history and existing languages
- Foundations and practice of Xtext
  - State-of-the-art language workbench (Most Innovative Eclipse Project in 2010, mature and used in a variety of industries)
- Models and Languages
  - Perhaps a more concrete way to see models, metamodels and MDE (IDM in french)

Models/MDE

- In essence, a model is an **abstraction** of some aspect of a system under study.
- Some details are hidden or removed to **simplify** and focus attention.
- A model is an abstraction since **general** concepts can be formulated by abstracting common properties of instances or by extracting common features from specific examples
- **(Domain-specific) Languages** enable the specification or execution of models

Generative approach

- Programming the generation of programs
  - Very old practice
  - Metaprogramming: generative language and target language are the same
    - Reflection capabilities

- Generalization of this idea:
  - from a specification written in one or more textual or graphical domain-specific languages
  - you generate customized variants

Grammar

```
machineDefinition:
  MACHINE OPEN_SEP stateList
  transitionList CLOSE_SEP;

stateList:
  state (COMMA state)*;

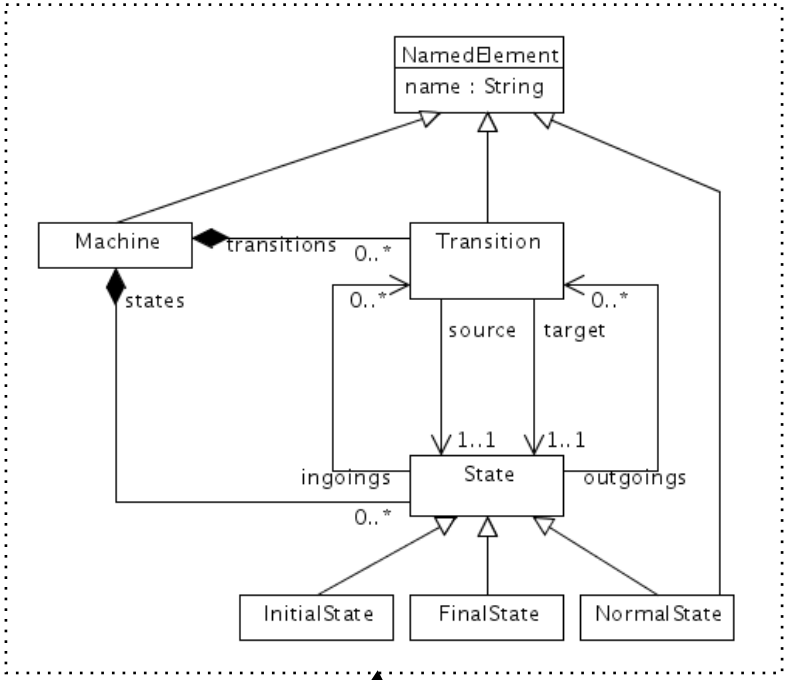
state:
  ID_STATE;

transitionList:
  transition (COMMA transition)*;

transition:
  ID_TRANSITION OPEN_SEP
  state state CLOSE_SEP;

MACHINE: 'machine';
OPEN_SEP: '{';
CLOSE_SEP: '{';
COMMA: ',';
ID_STATE: 'S' ID;
ID_TRANSITION: 'T' (0..9)+;
ID: (a..zA..Z_) (a..zA..Z0..9)*;
```

MetaModel



conforms To

conforms To

```
machine {
  SOne STwo
  T1 { SOne STwo }
}

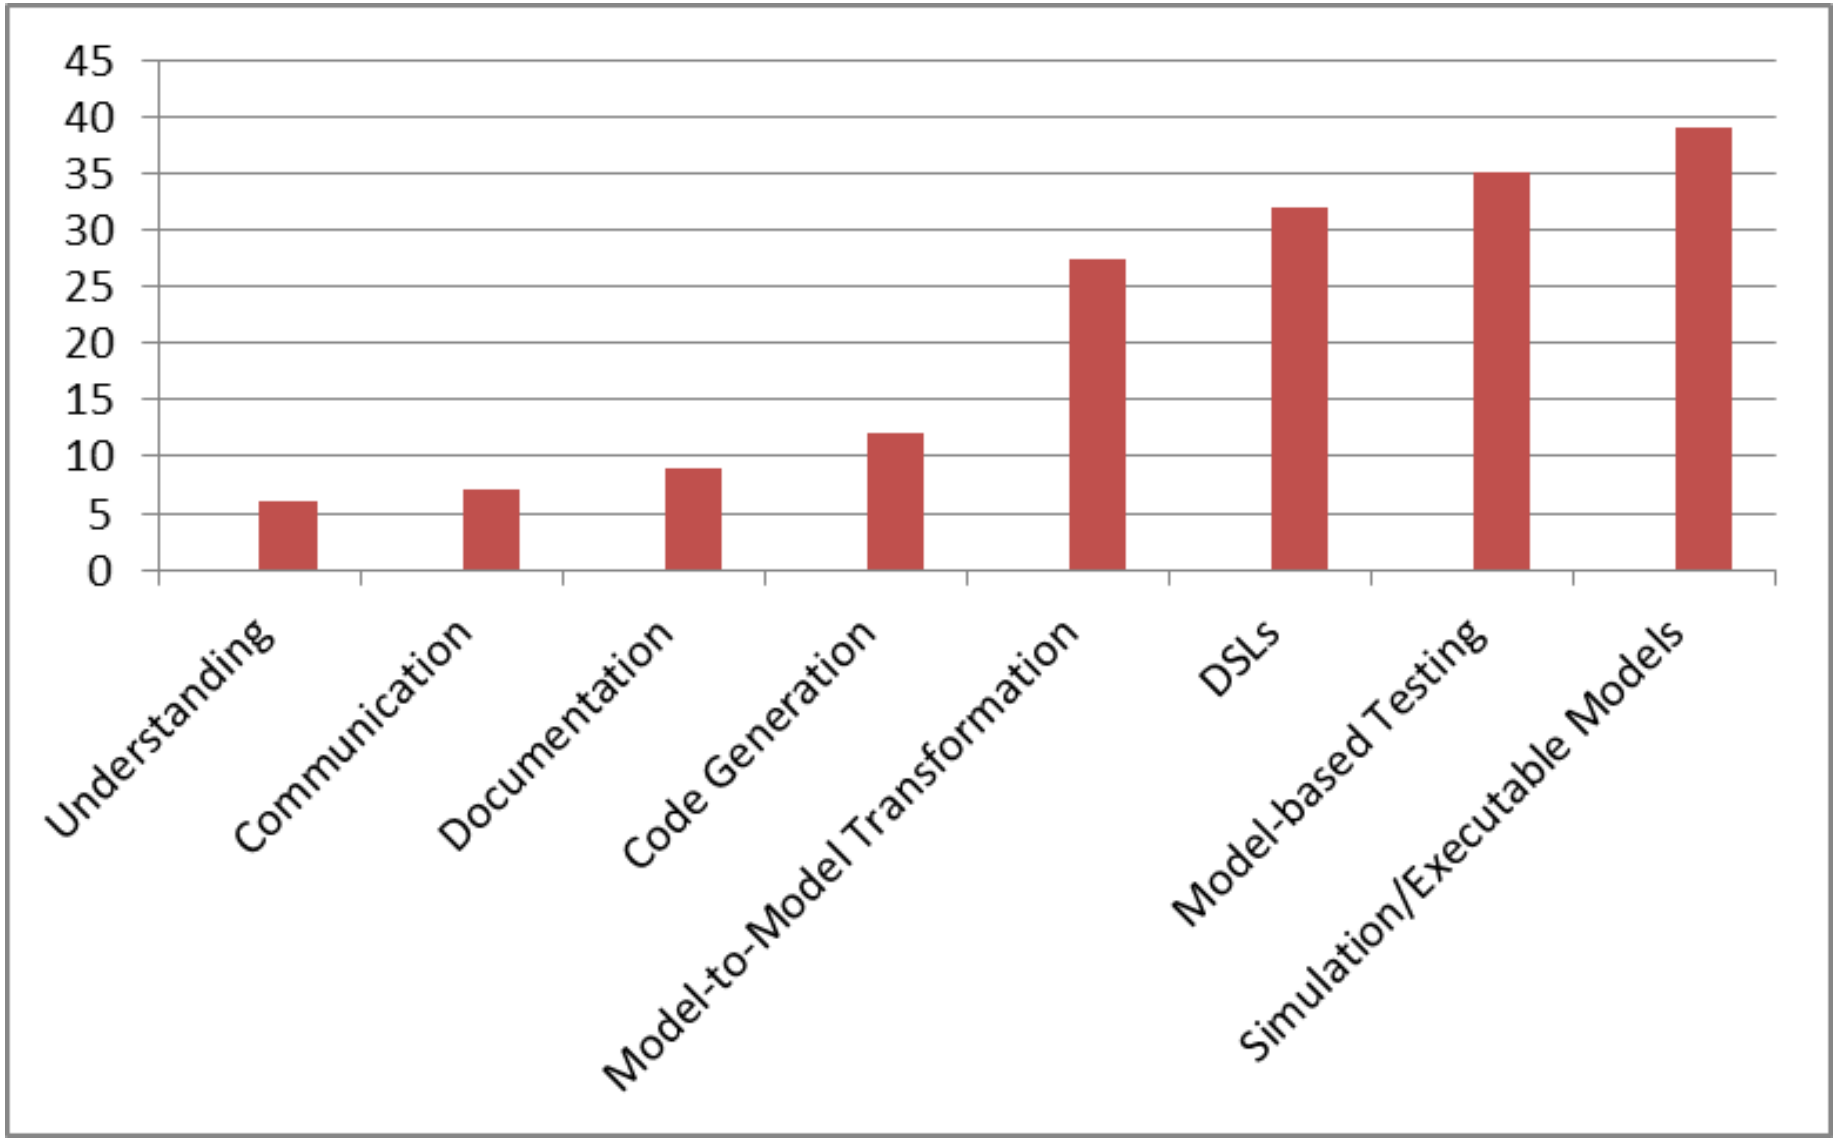
2011

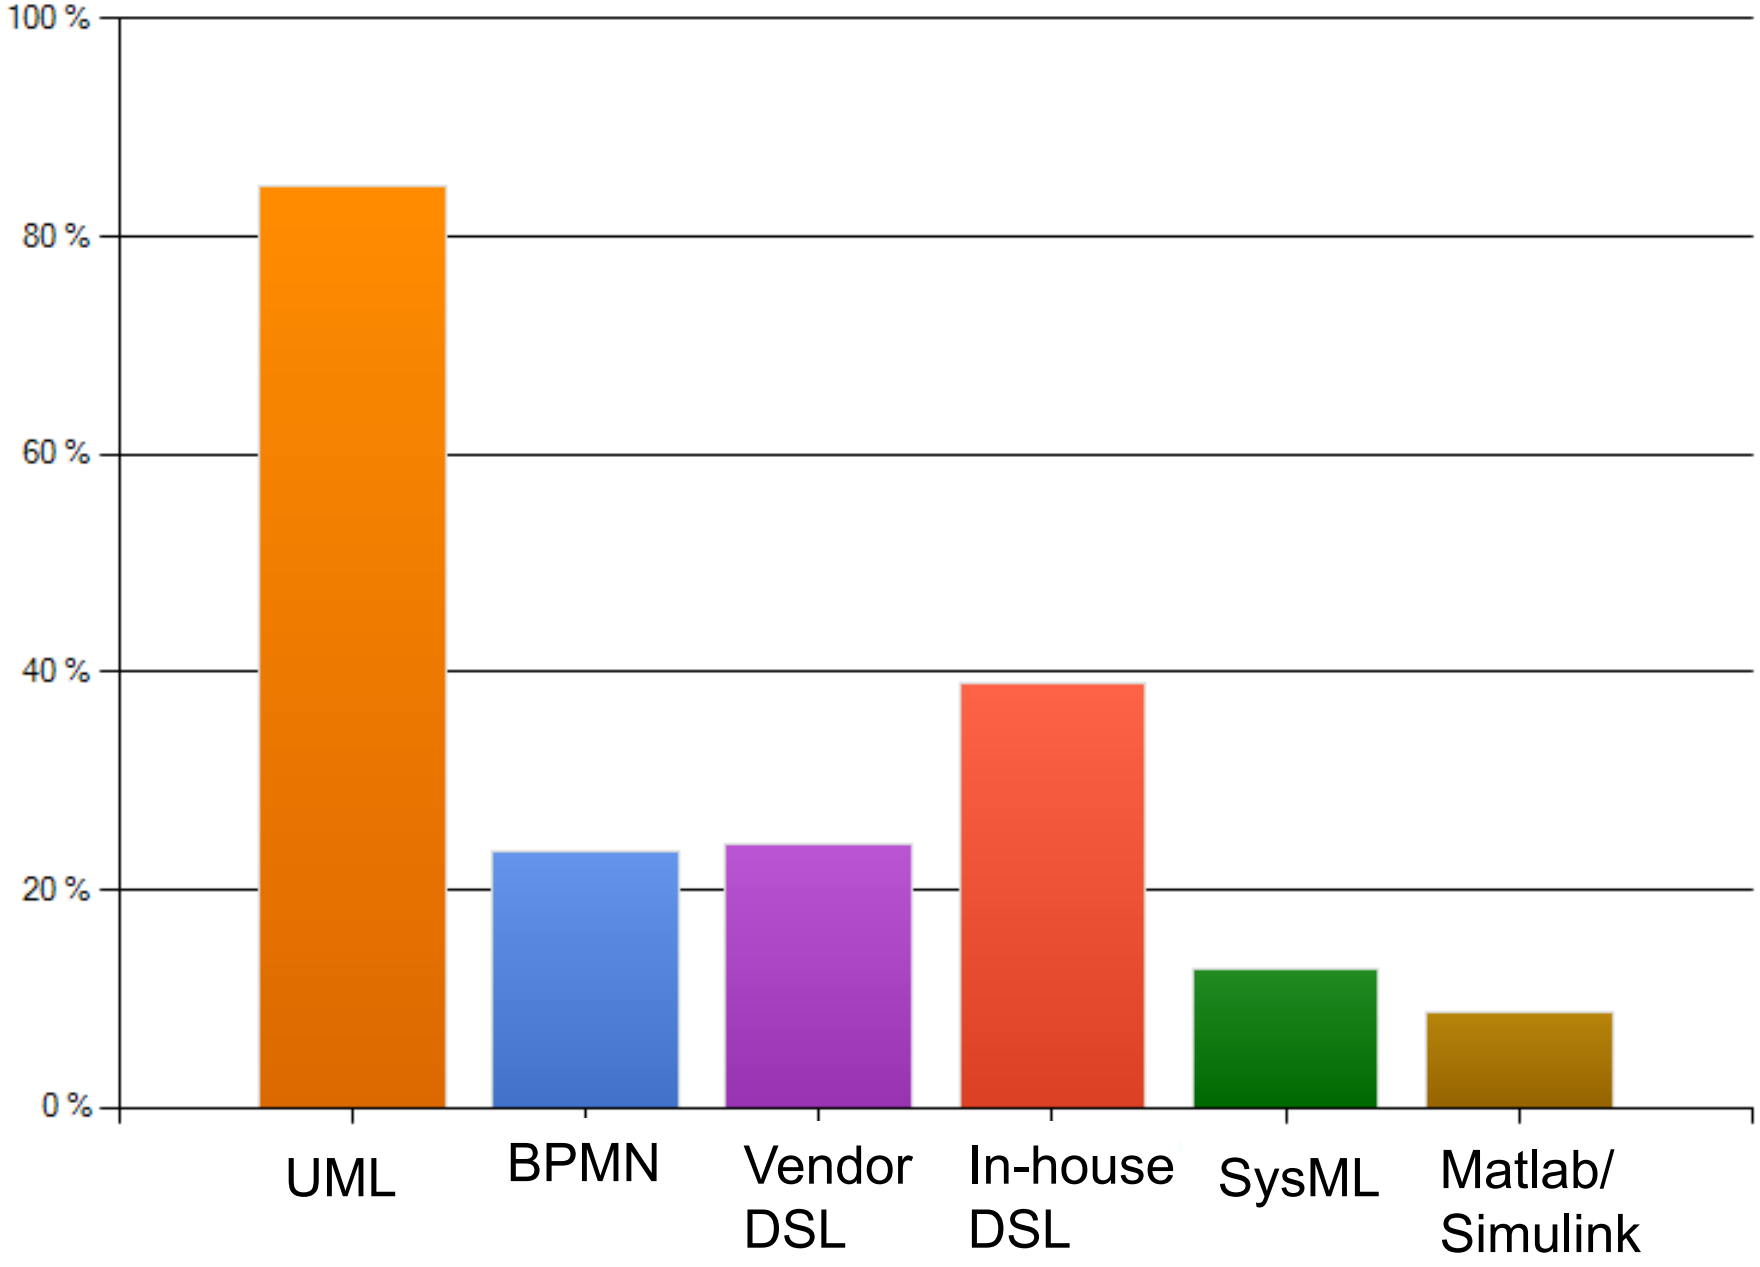
« Domain-specific languages are far more prevalent than anticipated »

What are models used for?

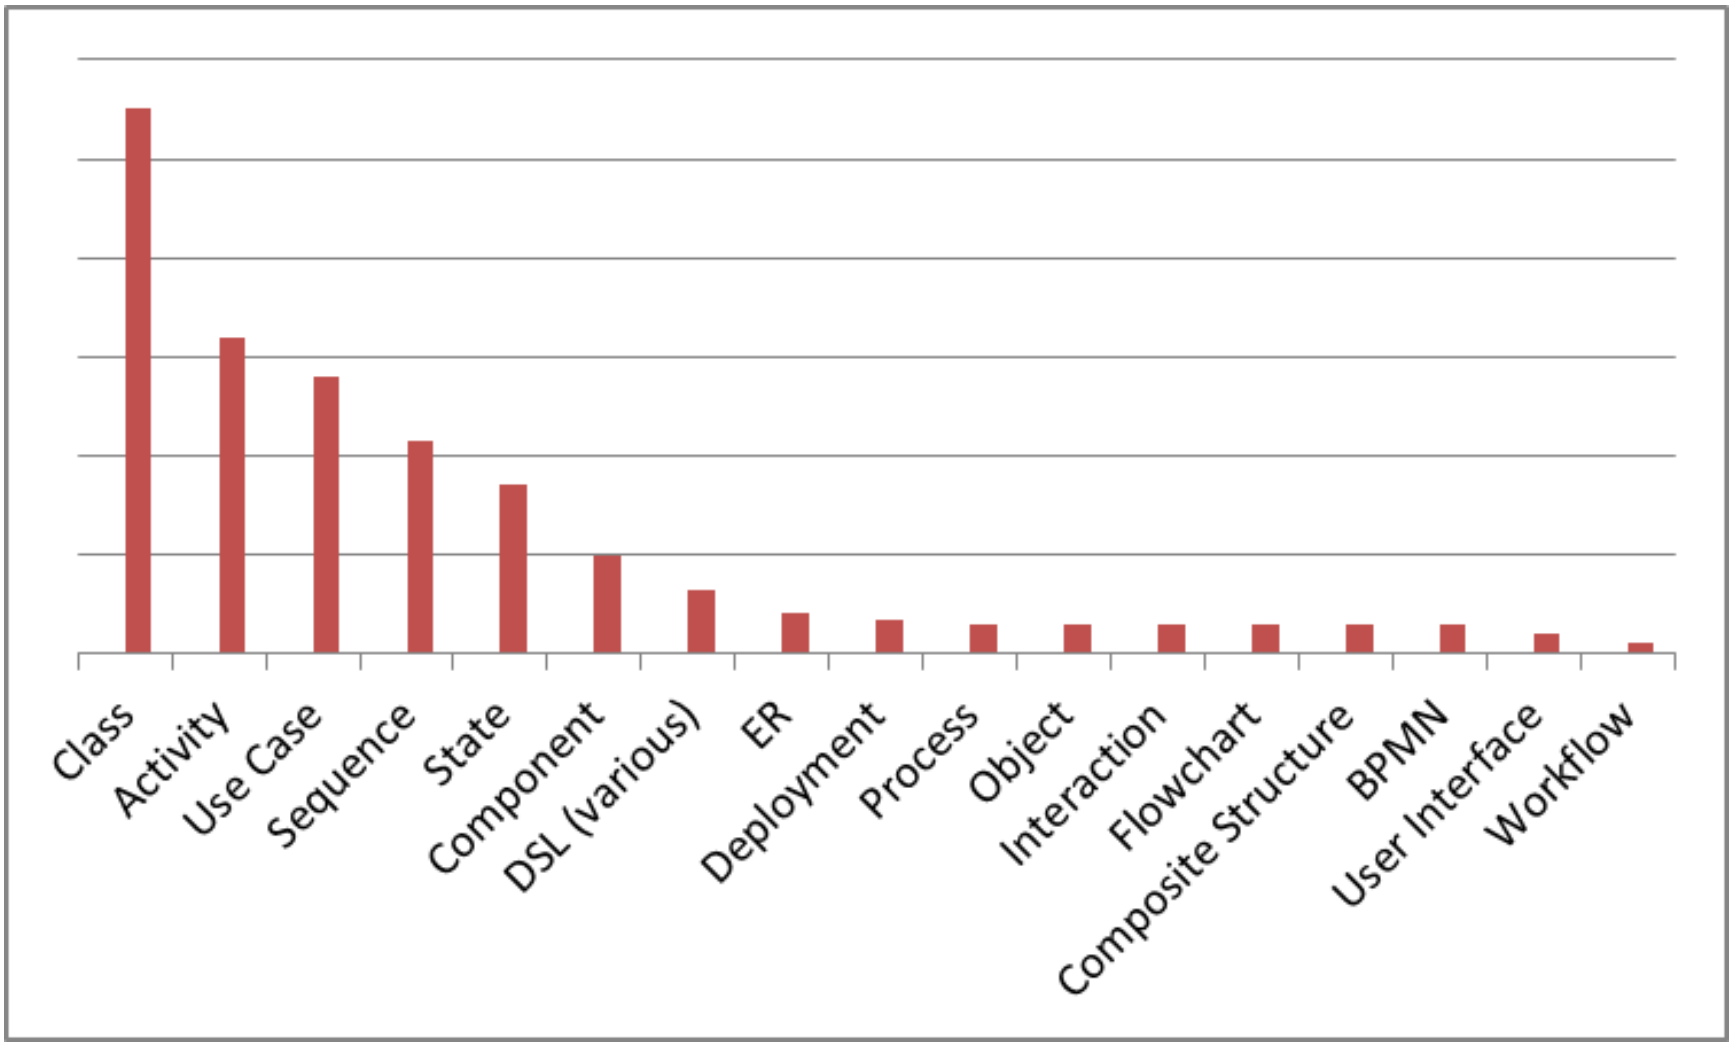


“Do not use” percentages for MDE activities

Which modeling languages do you use?



Which diagrams are used?

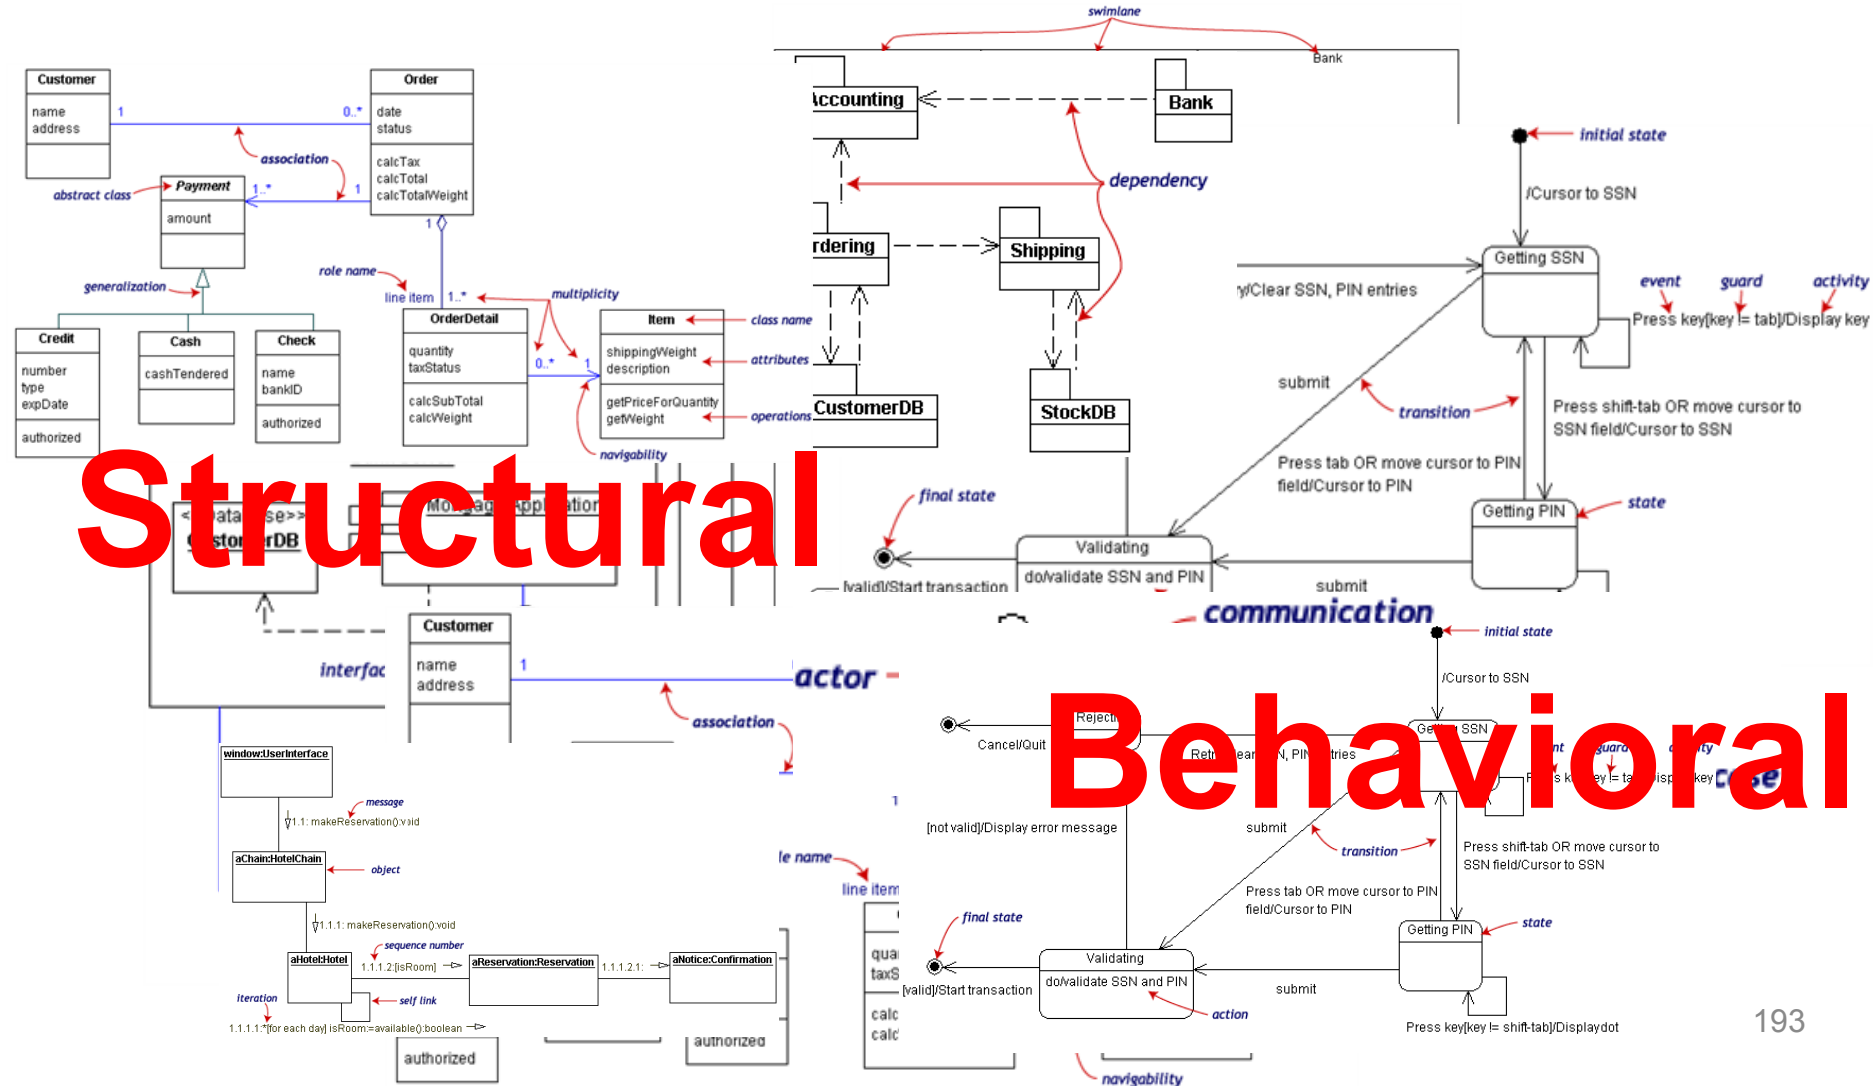


19 different diagram types are used regularly

Use of multiple languages (DSLs)

- 62% of those using custom DSLs also use UML
- Almost all users of SysML and BPMN also use UML
- UML is the most popular ‘single use’ language
  - 38% of all respondents
- UML used in combination with just about every combination of modeling languages
  - 14% of UML users combine with vendor DSL
  - 6% with both custom and vendor DSL

UML can be seen as a collection of domain-specific modeling languages



Xtext is built using MDE technologies

Xtext (and alternatives) democratize DSL development

My 3 take away messages

#1 DSLs are important (as intuited for a long time – it will become more and more apparent)

#2 DSL technology is here (no excuse)

#3 MDE meets language engineering

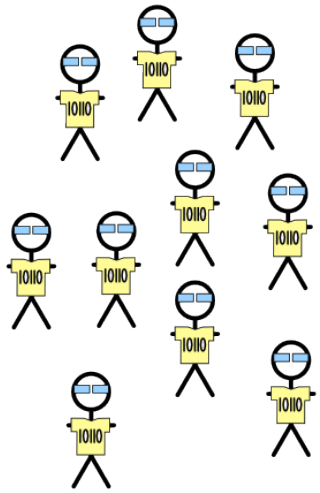
But my take away message is NOT

That DSLs should be used systematically, in every situations

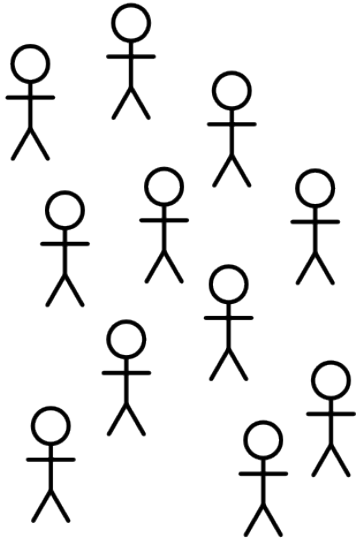
When Developing DSLs?

- Tradeoff cost/time of development versus producivity gained for solving problems
  - If you use your DSL for resolving one problem, just one time, hum…
  - DSL: reusable, systematic means to resolve a specific task in a given domain
- DSL development can pay off quickly
  - 5’ you can get a DSL
- But DSL development can be time-consuming and numerous worst practices exists

Actors

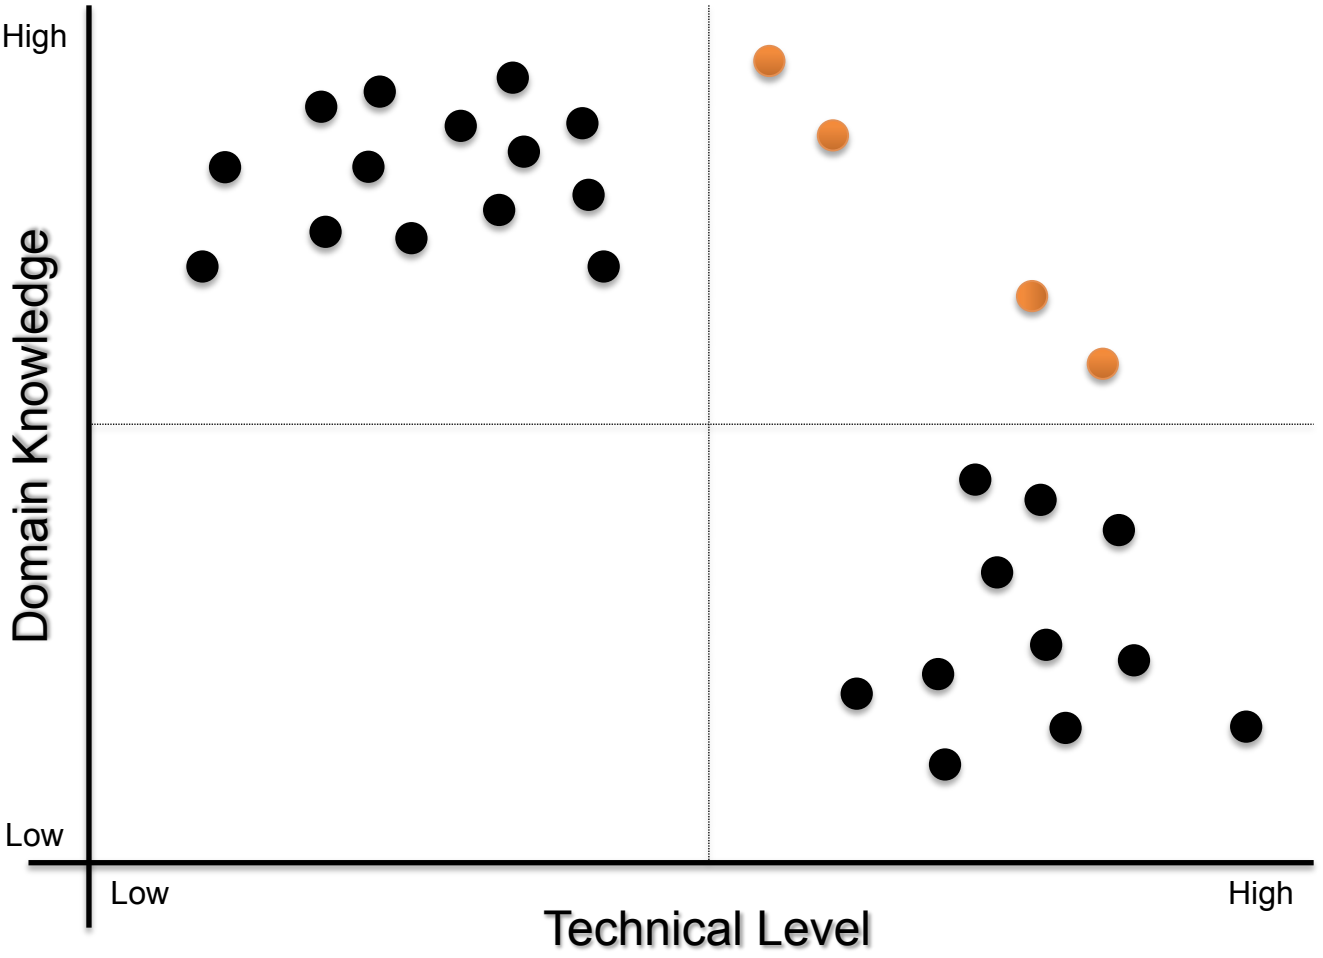


Developers

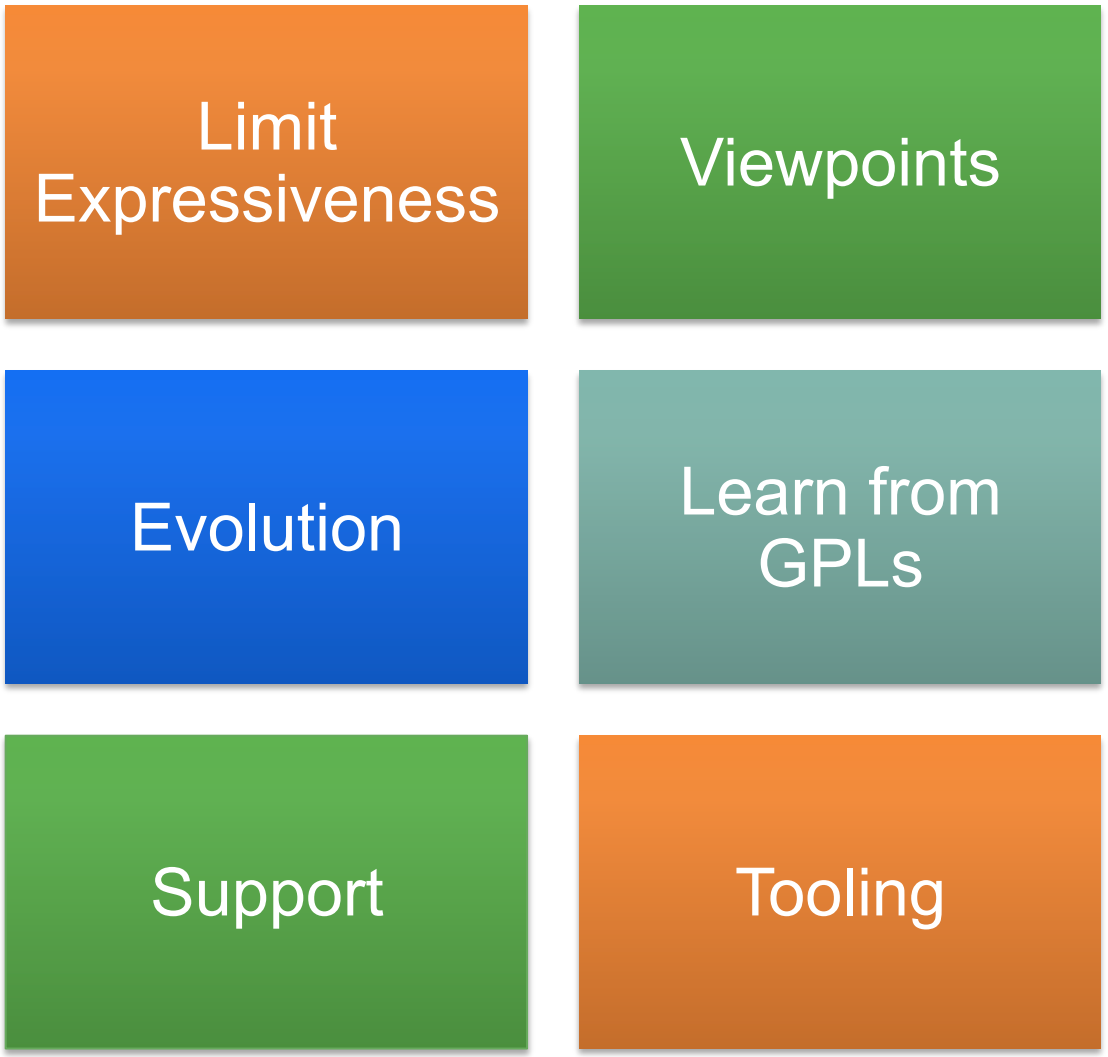


End-Users

Actors



Best Practices



Worst Practices

- Initial conditions
  - Only Gurus allowed
    - Believe that only gurus can build languages ir that "I'm smart and don't need help"
  - Lack of Domain Understanding
    - Insufficiently understanding the problem domain or the solution domain
  - Analysis paralysis
    - Wanting the language to be theoretically complete, with its implementation assured

Worst Practices

- The source for Language Concepts
  - UML: New Wine in Old Wineskins
    - Extending a large, general-purpose modeling language
  - 3GL Visual Programming
    - Duplicanting the concepts and semantics of traditional programming languages
  - Code: The Library is the Language
    - Focusing the language on the current code's technical details
  - Tool: if you have a hammer
    - Letting the tool's technical limitations dictate language development

Worst Practices

- The resulting language
  - Too Generic / Too Specific
    - Creating a language with a few generic concepts or too many specific concepts, or a language that can create only a few models
  - Misplaced Emphasis
    - Too strongly emphasizing a particular domain feature
  - Sacred at Birth
    - Viewing the initial language version as unalterable

Worst Practices

- Language Notation
  - Predetermined Paradigm
    - Choosing the wrong representational paradigm or the basis of a blinkered view
  - Simplistic Symbols
    - Using symbols that are too simple or similar or downright ugly

Worst Practices

- Language Use
  - Ignoring the use process
    - Failing to consider the language's real-life usage
  - No training
    - Assuming everyone understands the language like its creator
  - Pre-adoption Stagnation
    - Letting the language stagnate after successful adoption
